OPERATIONS in the C. and C. shaft at Virginia City, Nevada, continue. Frequent mishaps have not apparently discouraged the managers of pumping operations. It has been demonstrated that the principle of the hydraulic ejector is correct, and it has been known that the water can be forced out of the mine to a depth of 200 feet in greater volume than it flows in, so that eventually it may be expected that this experiment will prove a success. How great increase in depth below the Sutro tunnel level will affect operations remains to be seen.

No metallurgical process has had such widespread success in unexpected places as the cyanide process in its various forms, and still it may truthfully be said that it is still in an experimental stage, judging it from the broad standpoint of general application. In many places the constant experimenting by accomplished chemists is improving the results attained by securing higher percentages of extraction and reducing the expense per ton of material treated. In some localities it would appear that the highest possible results have already been reached; but even at Mercur and in the Cripple Creek district, in the United States, some advancement of commercial value may be looked for, and undoubtedly South Africa will also furnish some additional information on this important and interesting subject.

ALL new mining ventures are necessarily more or less hazardous in their nature, but no one familiar with the business of mining will deny that many prospects are of such a character as to justify a risk. Take as an instance a vein of a width and value, which if maintained upon development would prove largely profitable, surely such a prospect is entitled to the risk necessary to accomplish its development. The cause of many failures lies not in that the operators expended money in the development of a promising prospect, but that large sums of money are spent in trying to develop a rich mine where the prospect is not sufficiently good to justify the expense, or the resources of the individual or company are exhausted in the purchase and construction of expensive surface plant before development has advanced sufficiently to warrant it. The former is usually based on the proximity of a property that is good and the operators are taking a desperate chance—the latter is nearly always the result of inexperience. Each of these mistakes can be avoided by the exercise of common sense.

AN instance has lately come to light in Arizona wherein a company organized in the East has sold a large amount of its capital stock in that section, using the money thus obtained ostensibly in opening a valuable mine in Arizona. Recently a number of the stockholders visited the camp and in most cases were "well pleased" with the ore they found stacked up there—which, by the way, had been brought from mines several miles distant at considerable expense and exhibited as the production of this mine. According to the Phœnix *Republican*, it is a swindle of the grossest kind.

NUMEROUS letters are received from persons who anxiously inquire the value of stock in certain mining enterprises, or who seek advice on the advisability of making an investment in this or that mine. It does not fall within the realm of a newspaper to give information of the kind desired. In fact, such information can only be had by an actual, careful examination of a property. Those who contemplate an investment of any magnitude in a mining concern, whether corporate or not, would do well to employ a competent mining engineer to make an examination in their personal interest and be guided by his advice.

DIRECTORS of the Merced Gold Mining Co. of Boston, Mass., operating properties at and near Coulterville, Cal., contemplate increasing the capital stock of the company from $1,500,000 to $2,250,000, for the purpose, it is stated, of enabling the company to purchase additional properties and to more fully equip the proposition. The additional 50,000 shares are to be placed in the treasury subject to the order of the directors. A call has also been made for the last $3 per share of the original subscription. The president is credited with saying that if the stockholders authorize this increase of capital stock the company will be in position to pay all the net earnings as dividends when the mill starts again. It looks as though such an arrangement might be possible, if the directors are successful in placing a new issue of 50,000 shares at $15 per share.

OWNERS of prospects often seem to forget that the actual value of their properties may possibly be far below the price fixed by themselves. An instance of this was presented when, in response to an advertisement in the MINING AND SCIENTIFIC PRESS, the owners of antimony claims addressed a smelting company in San Francisco, Cal., that makes a specialty of handling antimony ores. The manager stated that he had received a large number of replies to his inquiry, but that in each case the owners held such exalted ideas of the value of their property or their ores that he was unable to do business. Claim owners sometimes read the quotations on the retail price of metals and expect to get this price or a figure near it for their raw product. This is of course an impossibility, as the smelters themselves do not as a rule receive retail prices.

REPORTS from the Cape Nome gold fields, almost on the edge of the Arctic circle, continue to be received by each returning vessel. The tales of fabulous wealth are intermingled with stories of claim jumping, death from exposure and improper food and now soldiers are to be sent to maintain the peace. From the south come other exciting telegrams of a scope of country in the desert region of Lower California, where nuggets as large as marbles can be had merely for the trouble of picking them up. These golden fields present two extremes of climatic conditions. One, those of cold, high winds and abundance of rain; the other of heat, destitution of water and every conceivable discomfort. That each locality will draw heavily from the restless men and women of the Pacific coast there is no doubt. The gold fever is as fatally contagious as the most virulent disease.

Concentrates.

MOUNTAIN LEATHER is a variety of asbestos.

TENSION in electricity is the same as pressure in steam.

THE melting point of gold is 2097° F.; that of platinum 3227°, and of tin 446°.

IN blasting work, always use a wooden tamping bar, never a metallic one of any kind.

THE present price of metallic copper is 18½ cents per pound, or $370 per ton of 2000 pounds.

ONE HUNDRED tons of waste broken in a mine will fill the space left by the extraction of 150 tons of ore.

ARAGONITE is calcium carbonate and is a chemical precipitate, occuring naturally from calcareous springs.

LIMESTONE is carbonate of calcium, often more or less impure, due to admixture with silica, clay, iron, etc.

A TRANSFORMER is an instrument used to transform a high pressure current to a low one, or the reverse.

DYNAMITE is a name given to all kinds of nitroglycerine powders, made by mixing the explosive with an absorbent material.

STANNITE is sulphide of tin. It is comparatively rare. Most of the tin of commerce is obtained from cassiterite, the oxide of tin.

A WATT is the unit by which electrical work is measured and is equal to the current of one ampere flowing at a pressure of one volt.

WHEN waste has to be hauled more than 1000 feet it is more economical to lay a light track and haul in trains of several cars drawn by horses.

MALLEABLE cast iron is a name given to castings which have been subjected to a process of decarbonization, making a crude wrought iron.

REFRACTORY clays are those varieties which resist the heat of ordinary furnaces, and consist of silica and alumina, the former predominating.

THE first cyanide plant installed in British Columbia is at the Doratha Morton mine, on Phillips Arm, 120 miles up the coast from Vancouver.

MANGANESE in cast iron tends to produce the white variety and it also increases its capacity for retaining carbon. It decreases the magnetism in iron.

WHEN blasting, high-grade powders will generally produce small rocks, and low grade larger rocks. The low-grade powders are employed in quarrying for this reason.

AN ampere is the unit by which the flow of an electric current is measured. A volt is the unit by which the electro-motive force or pressure of electric current is measured.

MINERAL TAR is made by distilling bituminous shales, and wood tar is made by the distillation of pine and other resinous woods. The residue left after distillation is called pitch.

CYANIDE solutions will not dissolve gold except in the presence of oxygen. When oxygen is withdrawn, dissolution of the gold ceases; when it is again admitted, the dissolving action recommences.

AN English industrial journal says there is more than likely to be considerable demand and development in chromic iron. California has numerous deposits of chrome ores associated with serpentine.

MANGANESE has more affinity for oxygen, carbon and sulphur than iron has. These properties are important and taken advantage of in the removal of oxygen from iron, and to obtain iron high in carbon.

THE affinity of steel for carbon varies with the temperature and the presence of other elements in the iron. Carbon in iron exists in three states: graphitic carbon, dissolved carbon and combined carbon.

A CAREFUL millman always makes an effort to amalgamate all of the gold possible in the battery. It is usually more easily saved there than subsequently on outside plates, canvas tables or concentrating machines.

LIME is the protoxide of calcium. It is caustic and almost infusible and possesses a marked affinity for water and will absorb 22% to 23% of its weight, generating much heat, and, passing into a hydrated condition, is termed slacked lime.

A "BLOW OUT" is a miner's term for an outcrop of quartz or other mineral at the surface. The name probably originated in the conception that a mineral vein was ejected from below in the same manner as a dyke of porphyry or other igneous rock is.

WATER may be appropriated for mining or other purposes on land in the public domain—that is, land open to settlement or location—where such water has not been previously claimed by others, and where its use will not in any manner injure the property of others.

EPIDOTE is a very common mineral in crystalline rocks, particularly associated with diorites. It is an aluminous silicate. It is usually yellowish green and may frequently be found in rocks containing hornblende and chlorite from the alteration of which latter it is formed.

THE tin plate of commerce is made from sheets of iron or steel covered with a coating of tin or tin and lead. Tern plate is of the latter variety. When a hole is made through the tin coating to the iron a galvanic action commences between the tin and iron and the tin is quickly eaten away.

A DRIFT BOLT is a rod of iron, round or square, which is driven in an auger hole of a dimension smaller than the rod, as an inch-round bolt in a ¾-hole, or an inch-square bolt in a ⅞ round hole. Smooth round rods hold better than square or jagged rods. Drift bolts are employed to hold large timbers firmly together.

A "SHORT CIRCUIT" in electricity is the term employed to indicate that a connection by means of metal or otherwise has been made accidentally between a positive and negative wire, by means of which the electric current is enabled to take a short cut, instead of completing its course through the lamp or motor.

ALWAYS give a "missed" hole plenty of time. It may go later. Do not try to pick out the powder. Remove most of the tamping and insert another stock of powder, and try to fire it again. A missed hole is often successfully fired in this manner without danger to the miner. No. 1 dynamite requires very little tamping.

ALL materials when excavated from the earth increase in bulk but some of them shrink later, occupying less space than formerly. Gravel will shrink 8% to 9%, while rock when broken from its place increases in bulk nearly 50%. Thirteen feet of quartz in place make about one ton, and 20 feet of broken quartz weigh a ton.

MINERAL WOOL, slag wool and silicate cotton are the names given to a glass-like fiber produced from the slag of blast furnaces, and is made by subjecting a stream of molten slag to a jet of steam or compressed air. A ton of it will cover 1800 square feet 1 inch thick. It is used for insulating heated surfaces, for protection against cold, and for deadening sound.

THE strength of pure iron is estimated to be about 38,000 pounds per square inch. An increase of .01% of carbon raises the tensile strength of acid steel about 1200 pounds per square inch, and of basic steel 950 pounds. An increase of .01% of phosphorus increases the tensile strength of acid steel about 890 pounds per square inch, and of basic steel about 1050 pounds.

ZINC, though ordinarily tough, when heated to a point near fusion becomes brittle. It is malleable and ductile at temperatures ranging from 210° to 300° F., and may then be rolled into sheets or drawn into wires. Zinc cannot be used in contact with copper, iron or lead, owing to the strong galvanic action set up by the contact of these metals, particularly in the presence of moisture.

THE Calumet mine paid its first dividend in August, 1870, and the Hecla its first dividend of $5 per share in December, 1869. The Red Jacket shaft on this property is vertical and about one mile in depth. It is 17x25 feet, with six compartments. It was started in the fall of 1889 and has passed far below the conglomerate bed. It is connected at several levels with other deep shafts on the mine.

UNDER the laws of California, a stockholder of a corporation becomes individually liable to each creditor of the company in an amount to be determined by taking such a part of each claim as each stockholder's stock is a part of the stock of the company, and an action may be brought against any stockholder, in the courts of any State where service may be had, to recover the amount due the creditor.

THE United States government does not now, and never has at any time offered a reward for the discovery of a tin vein or a deposit of mineral of any other kind. Tin occurs in a number of States, and had such a bonus ever been offered it would have been claimed long since. The person who finds a tin vein which will pay in the United States would not be long in gettting his reward, but not from the government.

WHERE rock is very hard, high-grade powder should be used in smaller quantity. The force of the powder is then well down toward the bottom of the hole, and should throw out the rock to the bottom or near it. Low-grade powders, when used in sufficient quantities, fill the drill-hole to a point so near the top that it affords insufficient resistance and the collar of the hole is blown off, leaving a considerable length of hole.

MINING corporations organized under the laws of California require that the superintendent or manager in charge of operations at the mine and works make a weekly report of the progress of work and the condition of the property. This weekly letter shall be accessible to all stockholders at the principal office of the company, and failure to furnish such statement or the issuance of an untruthful statement is a misdemeanor and punishable.

THE quantity of rock which may be broken by a given quantity of powder depends upon the hardness of the rock and the character of the ground, whether "blocky" or not; also upon the kind of powder used; but, more than anything else, upon the judgment used in pointing the hole or series of holes. A loud report does not always signify a successful blast. The reverse is usually the case; a muffled report generally indicates that the powder has done its work well.

PIG IRON is made by smelting iron ore in a furnace with coke or charcoal using either hot or cold blast. The latter is at ordinary atmospheric temperatures. Cold blast iron is usually of better grade for the reason that the hot blast, while more economical and producing a larger yield also causes the iron to combine with more impurities. From pig iron is produced three varieties of metal; cast iron, wrought iron and steel. The difference between these lies chiefly in the amount of carbon they contain.

PORTLAND cement is a name given to a composition of lime, clay and silica which, after being subjected to a high heat, causing it to vitrify, is ground and will in this condition, when mixed with water, crystallize and form a substance like stone, which resembles a natural stone found on the little island of Portland off the south coast of England. Nearly all of the Portland cement is made from artificial mixtures, though occasionally a deposit of calcareous clay is found which will produce a natural cement.

HEAVY flows of water at or near the surface which interfere with the sinking of a shaft may sometimes be overcome by constructing a structure of planks having a space between which is filled with clay, tamped down. This will shut out the water and sinking may be continued. As the excavation grows deeper the planks must be driven down to keep up with the progress. The system of forepoling and breast boards is described in a publication issued by the State Mining Bureau of California, Bulletin No. 2.

IN Colorado, the Court of Appeals has recently decided that in consideration of the sinking of a shaft in a mining claim, by certain persons, and obtaining a patent at their own expense, the owner of the claim contracted to convey to them a certain interest in same, provided the patent was obtained by a certain date. They sunk the shaft, paid him part of the expense of the patent, and notified him that they were ready at any time to proceed in the matter of the patent, but he advised delay, saying he should let them know when he wanted the balance of the money. It was held that he thereby waived the condition that the patent must be obtained by a certain date, and could not claim anything for non-fulfillment; and also that, as they could not take out the patent, all they had to do was to furnish the money for the patent.

THE process of tempering steel depends upon the characteristic, that after hardening, the steel on being reheated becomes softer as the heat increases. To produce steel of a certain toughness it is gradually reheated, and cooled at that degree of temperature which experiment and experience has shown will produce the desired degree of hardness. Heated steel becomes covered with a thin film of oxidation which, becoming thicker with higher heat, changes color. This fact is taken advantage of in tempering steel tools, as picks and drills.

TIN is less subject to oxidation than any other metal except gold and silver. It has a peculiar characteristic in giving out a crackling sound when a bar is bent. This is called the "cry of tin." The same phenomenon may be observed in large bars or masses by biting the edge with the teeth. When heated tin becomes very brittle, and when subjected to extreme cold for a long time it will be found covered with blisters; it becomes brittle and will fall to pieces, and eventually will be reduced to powder. The cause for this has not been definitely determined.

A NEW PROCESS for coating iron and steel consists in the use of a bath consisting of zinc, tin and aluminum. It is claimed that this produces a coating which is much superior to any now known, adhering so firmly that the sheet will stand working after it has been applied, and will resist corrosion and can even be heated red-hot without injuring it. The coating is applied in the same manner as in the well-known process of galvanizing; that is, by dipping sheets in the metal alloy. The most approved mixture is made by melting together 84 parts of zinc, 14 parts of tin and 1¼ parts of lead and 0.5 of a part of aluminum. The process is patented.

ELECTRICITY is now employed in seasoning timber. The stick to be treated is immersed in a solution containing 10% borax, 5% resin and ¾ of 1% carbonate of soda, the borax being used on account of its antiseptic properties and the sodium carbonate to assist to dissolve the resin. A porous tray, the bottom of which is lined with two sheets of canvas, with a sheet of felt between, is placed over the log, and a sheet of lead connected with the negative pole of the dynamo is placed above this. The positive pole of the dynamo is connected with a lead grating, upon which the log to be treated stands. The current is then turned on, and the treatment continued six to eight hours, by means of which the sap is driven out and its place taken by the solution. When the process is complete, the log is withdrawn and seasoned by drying, which requires, under favorable circumstances, several weeks.

ORES when received at custom smelters come from many mines in many districts, usually, and are made up of a great variety of ores. These are run through rock breakers and crushing rolls, sampled and then spread out in thin layers in a large bin. One consignment after another is thus laid down until the ore bed is several feet in thickness. Slices are cut or dug off vertically so as to get its proportion of each layer and the sample reduced to proper quantity is analyzed for silica, lime, iron, lead and other minerals as well as gold, silver, etc. The ore in this particular bin is then sent to the furnaces with the addition of such flux as may be required, if any at all, and the entire lot receives uniform treatment. The ores in an adjoining bin may have a somewhat different composition and will be treated accordingly. Smelters very rarely treat separately a "batch" of ore from a single mine. The minimum percentage of lead contained in a charge of ore is only limited practically by economic considerations.

THE gold first found which eventually led to the discovery of the Comstock lode at Virginia City, Nevada, was found by Wm. Prouse, May 15, 1850, who washed out a few specks of gold with a milk pan from gravel on a stream named by the discoverers Gold creek or Gold canyon. The placers yielded from $4 to $5 per day to each man. The canyon was worked towards its head, and in the winter of 1858–59 the vein afterward known as the Comstock was discovered by James Finney (who was known as "Old Virginny") and three others; but, although these men made locations, the value and character of the lode were not recognized. This was on Gold Hill. The discovery which created the rush to Washoe, however, was made by Patrick McLaughlin and Peter O'Riley on June 8, 1859, when they located on what afterward became the Ophir mine. They uncovered in a small hole, dug for a reservoir, to catch water for rocking the decomposed quartz, a vein of black sulphide of silver rich in gold. Comstock put in an appearance, and, recognizing the value of the discovery, claimed they were working on his ranch and forced the miners to locate him in. Through this the vein became known as Comstock's mine and later the Comstock lode.

THE law of Montana (Comp. St. 1887, div. 5, ss. 492–294), providing that the officers of a mining corporation shall have no power "to sell or otherwise dispose of" the whole or part of its mining grounds, mills, and plant, without such transfer being first approved by the holders of two-thirds of the stock, at a meeting at which at least three-fourths of the stock is represented, and that, if such sale be of the entire corporate property, the corporation shall be dissolved, is merely a limitation of the common law powers of directors and majority stockholders of a corporation, and does not authorize two-thirds of the stockholders of a prosperous company to sell all of its property against the protest of the other stockholders, or any of them. A transfer of all the property of a corporation to a foreign corporation organized by the directors of the former to acquire its property, in consideration of the latter assuming its liabilities, and agreeing to deliver to it its entire stock, stockholders of the former to exchange their stock for shares in the new company, or in lieu thereof to receive a fixed sum per share for surrendering them, is neither a sale nor an exchange within said provisions, conceding a sale or exchange to be authorized by such law. This is the gist of a recent decision of the Montana Supreme Court in the case of Forrester vs. B. & M. Consol. C. & S. Min. Co.

Cyaniding Slimy Ores and Tailings.

Written for the MINING AND SCIENTIC PRESS by MATT. W. ALDERSON.

Part 1.—Historical and Introductory.

When the cyanide process was first introduced into the United States there were mining men in Montana who were enterprising enough to give it a trial. Tested at Revenue it proved a success on ores which baffled all attempts at amalgamation and concentration and the mill has been operated as a cyanide mill ever since, having a capacity at the present writing of seventy tons a day. Tested at Iron Rod on a large accumulated pile of tailings, laboratory results were very encouraging. In the firm belief that an actual extraction of 85% to 90% could be depended on, a plant was put in at a cost of over $10,000, consisting in part of eight vats 10 feet in diameter, 4 feet in depth. Failure followed the venture, principally because of the slimy nature of the material. A similar result occurred at the Southern Cross mine, another prominent property. Not to be discouraged, the proprietors of Iron Rod made other attempts in years following to overcome the difficulties, the most successful being where the material was dried and the fine and coarse particles thoroughly mixed together. A test run was made in this way that was fairly successful, the extraction secured being 54%. In the winter of 1895-6 laboratory tests were made in Bozeman, where extractions as high as 96% were secured in a quarter of an hour with a cyanide solution containing five pounds to the ton. As the values in the tailings consisted of about $10.60 in gold and $1.40 in silver, it was easy to figure out immense fortunes in working the material. A company of Bozeman men arranged with the owners to handle the tailings on a percentage of their assay value. F. W. Traphagen, Ph.D., F. C. S., who has the reputation of being the best chemist in the State, went to work to elaborate a scheme whereby the material could be handled and he decided, after a large number of laboratory experiments, on a combined system of agitation and percolation, the slimes to be coagulated by the use of lime during agitation, when percolation could be carried on without difficulty. It worked beautifully on a small scale, and with the opening of spring arrangements were made to put the plan in operation. Being on very friendly terms with the experimenter, and being also very much interested in the success of the project, I was an invited guest at Iron Rod when operations commenced. The agitator was built, charge was put in, material was flocculated and everything worked as nicely and smoothly as anyone could wish, until attempt was made to draw the fluid. Every effort to secure percolation of the charge resulted in absolute failure.

In observing the working of the charge, I was much impressed with the fact that the moment agitation ceased the sand and slimes sought the bottom of the vat and the fluid rode the top. I remarked that every successful invention was the result of working with nature and not against it, and that successful handling of slimes would come about from drawing the fluid from the top, where it naturally came, and not from the bottom, where it refused to go. The attempt to secure the gold-bearing fluid by percolation was discontinued and decantation was attempted. It is not necessary to detail the syphoning arrangements that were used until the simple expedient was adopted of drawing the fluid through holes in the sides of the vat, but it is sufficient to say that the mechanical difficulties in the way of treating the slimes were soon overcome.

The conclusion naturally was that the troubles were over and that there was smooth sailing ahead. Instead, the troubles had but just commenced. The cleanups were disappointing and failed to anywhere near correspond with the recovery as shown by the assays. In the first place, such a proportion of the gold as had been expected from laboratory experiments could not be obtained in solution. This was surprising, for it was never dreamed that the very carefully conducted experiments in the laboratory would fall short in actual practice. It was one of those cases where something was done in the laboratory in a slightly different way from what was done in actual work, and that little something, overlooked and undetermined for many months, cut a very important figure. In the second place, the precipitation was imperfect. There were times when from $3 to $6 were in the solution after it had passed the extractor. Those were days of discouragement—face to face with the fact that the amount of gold expected could not be dissolved from the material, and that such gold as was dissolved could not be taken from the solutions. In the attempts to overcome the first difficulty, trial runs were made with different strengths of solution; vats were agitated for long and short periods, from three to seventy-two hours; tests were made with solutions ranging in temperature from 50° to 120°, etc. Whatever was done, there was no material difference in results; an extraction of 60% to 65% was all that could be secured. The assayer had served in that capacity for a successful cyanide plant, and had had charge of the zinc boxes; but he could not make those at Iron Rod do perfect work, and, looking back at them now, it could be said that they were truly sorry sights. Polarization must have prevented any action to amount to anything; the compartments were filled with a white, curdy material, and the zinc shavings themselves were incrusted with slimes and cyanide of zinc. Occasionally whole compartments would be a brilliant copper color, and the merest trace of copper was enough to cause all the blame to be laid on that metal. Various expedients were resorted to to overcome the copper, to prevent its precipitating on the zinc, to precipitate it first and then precipitate the gold; but copper in an alkaline solution is, like gold and silver, not easily precipitated. Then, in reality, the presence of copper was but partially to blame for this imperfect work. It was due principally to the bad condition of the zinc and lack of chemical action of sufficient strength. When these were remedied, the amount of gold in solution, after it had passed the extractor, ran about 40 cents in gold per ton. This was much better than leaving $6 a ton in solution, and, after failure upon failure through the summer, a run was made where the actual recovery was equal to what the assays showed it should be. An extraction of about 62% was secured and the gold recovered. In the meantime, the manager had resigned, though continuing to give the company the benefit of his chemical skill; the assayer had left, there had been some change in the personnel of the company, but the writer was in charge when the tide was turned from failure to success.

On page 581 is given an illustration of the mill at Iron Rod, the first plant in the United States successfully handling slimes on a large scale. It has four agitators and eleven other vats, has a daily capacity of thirty to forty tons and is in operation under the superintendence of Charles L. Dahler, one of the owners of the property.

Such, in brief, is the history of early attempts to treat slimes in Montana—attempts, however, which led to better work later on and to the formulation of a system yet to cut a very important figure in swelling the gold production of the country. Even such tailings as those at Iron Rod, which are tailings from a custom mill where a great variety of ores have been milled and concentrated, affording therefor more opportunities for complications than tailings from the ore of one mine, the skilled cyanider would not think of treating to-day for an extraction of less than 90%; and he would obtain this easier, in shorter time and at less expense than he could obtain 65% a few years ago. But the skill by which this may be accomplished has not been acquired in a few weeks or a few months; it has taken time as well as intelligent study and much costly experimental work.

(To be Continued.)

Graphite.

Not a single iron casting is taken from its sand mold without the sand being first faced by graphite. Not a gun projectile is cast but the steel is melted in a graphite crucible; not a tool, not a saw is made but from graphite crucible steel. Every pound of nickel, of copper, of composition metal, of brass, is cast in some way, the metal being reduced in a graphite crucible. Every printing house, for the perfection of its electrotypes, is absolutely dependent on graphite. Every electrician and every department of electrical work comes under the same tribute. Graphite lubricates friction ways; it is notably the most enduring paint pigment, and the bulk of the writing done on the globe to-day is done with a graphite pencil; it has ministered to the arts of peace and to the science of war. It saves labor and it proves a short cut to desired results. In brief, not a factor which to-day contributes to civilization but is helped by graphite. It is found in great abundance in the island of Ceylon, in the Indian ocean, and next in quality at the graphite mines at Ticonderoga, on Lake Champlain, New York State. The industry is fascinating from the moment the miner drives his drill, and all along the line of its being refined until both in usefulness and beauty it reaches perfection. The electric light would shine much less easily but for graphite, and the production of steel rails is equally dependent. The beautiful mineral has peculiar characteristics. Heat and cold and the highest and lowest extremes of both cannot touch it. It can bathe in acid as does a pebble in cold water.—Bradstreet's.

Klondike Output for 1899.

Under date of April 29, 1899, Consul Brush, of Clifton, says: An authority whose estimates have heretofore proved conservative, brings word from Dawson that the washup from the Yukon this year will aggregate $19,000,000, apportioned as follows: El Dorado, $2,500,000; Bonanza, $2,500,000; French Hill, $1,500,000; Gold Hill, $1,500,000; Big Skukum, $1,000,000; Little Skukum, $1,000,000; Dominion, $4,000,000; Hunker and Quartz, $5,000,000; total, $19,000,000. These figures leave out of consideration a number of important locations, including Sulphur creek, Stewart river, Upper Klondike and Scroggie creek.

Dry and Wet Crushing.*

By FRANK MERRICKS, M. Inst. M. M.

The subject of dry versus wet crushing has recently been so prominently before the minds of mining engineers that the author has been prompted to bring it before the members of this institution, with a hope that they will contribute their views on the matter, and thus perhaps be the means of saving many a manager much worry and expense in deciding whether he should adopt dry or wet crushing for the treatment of the particular class of ore he has to deal with.

The author is fully alive to the fact that a process or plant ought to be adapted to the ore for its proper treatment; but in this respect mistakes have occurred, and are often duplicated in the same district, by one company following the mistake of another.

The physical conditions obtaining in any particular district have also to be seriously considered in deciding on any ordinary or special treatment of ore; and perhaps, in certain cases, the process best adapted to the ore has to give way to one less suitable, as regards treatment, owing to existing conditions.

A great impetus to dry crushing was given by the introduction of rolls and ball mills, which, in many of the best designs, are ill adapted, or totally unsuited, to wet crushing. The merits claimed for this class of mills are: They cost less, are easier and more quickly erected, produce a pulp of a more even consistency, and require less power, than stamps. These merits are probably well deserved and applicable in some districts and with certain ores, but, in the long run, it is a very open question if they are more economical than stamps, even as dry crushers.

Dry stamp crushing and cyaniding has been carried on on an extensive scale at several of the mines in the Upper Thames district of the Hauraki Peninsula, New Zealand, and so far as the extraction of the bullion is concerned, with fairly satisfactory results. The percentage of extraction of the bullion by the ordinary amalgamation process was so small, that to use this method was hopeless ruination.

A short outline of the processes tried and results obtained, and the eventual adoption of dry crushing and cyaniding at the principal mine, the Waihi, may be of interest. The first two tons of ore from this mine were wet crushed (about '80) and amalgamated on copper plates, the bullion saved being 35% of the original value of the ore (£4 4s). During seven or eight years after this, 18,000 tons of ore were treated by wet crushing and amalgamation for an average return of 13s 6d per ton. The author does not know what percentage of the total bullion contents this represents.

During some four years later, '90-94, a series of experiments were made. The ore was treated by pan amalgamation, and both dry and wet crushing were resorted to, with the result that in the former case 70% of the gold and 45% of the silver, while in the latter 60% of the gold and 25% of the silver, were saved. It is reported that the duty of the stamps in each case was practically the same, but by wet crushing the calcined ore the output was increased 30%, while the extraction still remained 10% in favor of dry crushing. In '94 pan amalgamation gave way to cyanide treatment, the ore being dry crushed, with the result that an average extraction of 90% of the gold and 50% of the silver was effected.

The results, corroborating those obtained at the Crown mine in the adjoining Karangahake district, were considered so satisfactory that the companies in the surrounding districts, where the ores are of a somewhat similar nature, adopted this process, without for a moment considering the advisability of trying raw wet crushing and cyaniding, or even attempting any modification whatever.

About eighteen months ago, at the Crown mine, wet-crushing experiments were made with cyanide solution passing through the mortars. The method of handling the slimes and the results obtained have not yet been made public, but are presumed to have been satisfactory as the plant has been changed to wet crushing.

At the Waihi mine the low results obtained by ordinary amalgamation are accounted for by the fact that the gold is in a very fine state of division in the ore, and that the proportion of silver to the gold in the bullion is excessively large, the fineness being about 640. Very rarely can any gold be detected with the unaided eye, or even with a magnifying glass, or in panning.

The difference in the above results, both as regards dry and wet crushing and the extraction returns of such, by treating the ore by the cyanide method, call for more serious comment. It is generally admitted that drying the ore previous to crushing renders it more amenable to the cyanide treatment, probably owing to the fact that, although the pulp is reduced to such a fine state of division in crushing it is of a more porous nature, which is mainly brought about by the dehydration of the ore. This may partly account for the difference of 10% in

*Condensed from a paper read at the Institution of Mining and Metallurgy, London.

the extraction results, although the author is inclined to the belief that it may also be due to the floating away of some of the sulphide of silver and of the fine gold, and also to the want of a proper method of sampling.

The increase in capacity by wet crushing of only 30% over dry crushing is rather remarkable. Probably this increase was looked upon as the maximum duty of the stamp, which, combined with the fact that the increase of 10% in the extraction is in favor of dry crushing, was considered so satisfactory that wet crushing entirely gave way to dry crushing.

Since the matter of wet crushing has been so seriously taken up by the Crown Co., most of the other companies are following its example, and, although in some cases the results are said to have been indifferent, there is every indication that during the next year most of the ore will—and ought to—be wet crushed.

The author is of the opinion that the improvement effected at the Crown mine should be completed by adopting wet crushing, amalgamation, and cyaniding in its entirety. By this means the output would be greatly increased, say to three tons, for a less cost than at present dry crushing one and one-quarter tons, and, supposing the percentage of extraction is a little less by wet crushing, it would be more than counterbalanced by the increased output.

The bulk of the Upper Thames ores present no greater obstacles to wet crushing than did those of the Rand. Dry crushing has been repeatedly tried at different mines in the latter district, but has been abandoned in favor of wet crushing; in fact, were it not for the high stamp duty, it is very certain that the greater part of these ores could not be profitably worked.

In drying the ore in the crudely constructed kilns, excessive heat often becomes localized, and occasionally the gold gets melted, which, in the form of small pellets, is not dissolved by the weak cyanide solution.

At the present time a great divergence of opinion exists as to whether dry or wet crushing is the better and more economical method for treating the Kalgoorlie ores, West Australia, and in the author's opinion this problem is not yet solved.

In the early days of this field, when the surface or oxidized ores were treated, wet crushing and ordinary battery amalgamation were principally resorted to for extracting the gold, but owing to the fine state of division in which a great percentage of the gold existed in these ores, together with a short supply of water for battery purposes, only a poor extraction was effected, thus leaving the tailings very rich, may of which have been, and are being, treated by cyanide. As depth was attained, and tellurides, carrying a high percentage of gold, were met with, combined with the paramount water question, serious obstacles were presented in devising the best methods for the most efficient and proper means of treating these somewhat rare and complex ores. The most prevailing idea, at present, appears to be that they ought to be dry crushed, roasted, or vice versa, and then subjected to cyaniding.

Great difficulties, however, are met with in adopting this course, the first being the coarse gold, while in roasting, the gold in the rich telluride forms into pellets, in both of which cases the gold will be left in the tailings after cyaniding, and to extract it a further treatment will have to be employed.

In roasting there is the risk of loss of the precious metals by volatilization, and in cyaniding any tellurium left in the ore will be dissolved by the cyanide and precipitated by the zinc, thereby causing a further loss of gold by volatilization in roasting the precipitate.

Taking into consideration the general characteristics of these ores, notably their friable nature, their gold (often coarse) contents, which extend below water level, and their association with rich tellurides, it would appear that the above treatment is somewhat involved, necessitating much extra handling of the ore and very careful manipulation in connection with the roasting, and consequently rendering expenses somewhat high.

The method which suggests itself as being the best and most suitable for the handling and treating of these ores is, first to hand-pick the rich tellurides and to bag such for smelting. In regard to crushing, to break down the ore to a small size by means of crushers, and then to stamp wet, and to guard against sliming, crush as coarse as possible consistent with economical working and general conditions obtaining and to collect as much gold as possible by ordinary amalgamation; then to concentrate the tellurides and bag for smelting, the tailings, if carrying sufficient gold, being treated by cyanide, and the slimes collected by, and treated in, filter presses.

THE copper lodes of Butte, Mont., occur in great fissures from 10 to 100 feet in width, in granite formation, and cover an area laced with veins of silver and copper ore. Of the 4000 mineral locations in this district, 50% of them are located in the copper zone, yet less than 100 of them have been explored. No ledge yet explored in the copper zone has shown any sign of weakness with depth, and in no instance has the bottom of an ore chute been found.

Some Experiences of a Working Miner.

NUMBER XVIII.

Written for the MINING AND SCIENTIFIC PRESS.

No one, perhaps, had a better opportunity to see the outside and inside workings of the S—— J—— E—— Co. than myself. The fame of the mines and of the company had already became world-wide when I drifted into camp in search of a job, either hard or soft—the latter preferred. There seemed to be plenty to do and an army of men to do it. A scene of greater activity is seldom found any place than could be witnessed about the C—— mine, the principal one of the large property owned by the company.

No less than 150 men were employed in various occupations. Some were grading roads, some were making gardens, others building stone walls, and still others were aiding in the construction of numerous buildings. The bare, treeless hills which for years had been frequented only by bands of sheep and their herders, had as by magic been transformed in a night, as it were, to an active mining camp. It was a pretty sight, too. The numerous buildings were neatly painted, most of them were covered with corrugated iron roofs, and the bright colors with which they were adorned made the otherwise sombre landscape more than attractive. The office was the principal edifice, with its broad verandas and white-curtained windows; a tower surmounted the structure, and over all was reared a flagpole, glaring white and topped with a ball of gold. Beyond, in process of construction, stood two large "porcupine" boilers, whose dull-red color made a striking contrast with the prevailing gray of the hills and the yellowish shade of the buildings.

A little beyond the boilers great piles of red and white bricks were being consumed in the construction of reverberatory furnaces.

Timbers for the mine and lumber for more buildings were piled on the level pieces of ground about the camp, and men could be seen everywhere. About 10 o'clock each morning, with a rush and a rattle, the company's wagon—a grand affair, finished in the latest style of the wagon maker's art, enclosed and bearing a coat of arms—would dash up to the office, and the mail would be thrown out, fresh from the railroad.

Men were at work everywhere—except in the mine. I believe, on second thought, there were four men in the mine. I had almost forgotten them.

A mile or so away another small army of men, employed by the same company and under the same management, was building an elaborate and expensive dam across a gulch in which no living water ever ran.

Thousands of dollars—hundreds of thousands of dollars—were being energetically wasted on every side. The outfit would have done credit to a Homestake or an Alaska-Treadwell. Indeed, these mines in their early history did not begin to rival this new enterprise for extravagance and style. To look at the result of the money invested—the buildings, the machinery, the dam, the army of men and the gorgeous wagon with its richly harnessed team, one would naturally suppose that the S—— J—— E—— Co. had a great mine.

If they had no one has ever been able to find it out. I went into the mine and saw a vein 4 to 12 inches thick which was only developed to a limited extent, and on this—a mere prospect—half a million of dollars was spent in senseless surface equipment and display. Later the company did produce something like $20,000 in metal and the mine was exhausted, or at any rate abandoned. What metal was produced did not pay for the actual cost of production, giving no consideration to interest or capital.

Several miles away the same company had a group of gold mines. Among them were some fairly good prospects. A superintendent was in charge who was physically incapacitated from doing anything himself. This man had a crew at work cutting out a broad strip through the greasewood and chaparral, presumably on the course of the vein, though in fact it was not on the course of the vein at all. Although this latter enterprise was not so bad as that at the main camp, it was bad enough and like the other was a failure under that management. The whole outfit was closed down and since, the machinery, piece by piece, has been sold at the price of old iron and hauled away for use elsewhere.

* * *

The president of the E—— C—— mine was spending a fortnight at the mine, and being a close observer, could not fail to notice that the tally board in the hoisting works did not show the same quantity of ore being hoisted daily, consequently he went to the superintendent and said: "This hoisting engine is a good machine, isn't it?"

"Yes," replied the superintendent, "it is a very good engine." "Well," said the president, "I have been noticing that the amount of ore hoisted daily varies a great deal. For instance a few days ago you hoisted 100 tons, the following day 200, the next day 250, day before yesterday only 100 and yesterday 150 tons. How many tons could you hoist with your engine?"

"Oh," replied the superintendent, "perhaps 1000 tons."

"Well," said the president impatiently, "why in h—— don't you do it, then?"

* * *

A friend of mine told me the other day that he was once employed as assayer by a company which had as manager a man who had been engaged in lumber business all his life and had never seen a mine or mill before coming to take charge of the one referred to. One day the lumberman manager came into the assay office where my friend was pouring some assays, and noticing that the slag was dumped into a refuse box suggested that it would be a good plan to economize by saving the slag, crushing and grinding it and reusing it in making new charges. At another place, when making application for the position of assayer, he was asked by the superintendent if he could cook, it being the idea to employ a man who could do both. Usually competent assayers are satisfied to confine their culinary attainments to the cooking of ores, etc. He also related the story of a new manager who hastily went to the carpenter shop and ordered the carpenter to make half a dozen shovel handles at once, as he had sent to the store for the shovels, which would soon be down.

* * *

When B—— was superintendent of the C—— W—— mine it was told of him that he sent 250 miles to the nearest store and ordered 500 rasps. The storekeeper sent two dozen rasps—all he had on hand—and sent a letter to the superintendent expressing his pleasure at the receipt of so handsome an order, and incidentally asked to what use he intended to put them. The answer came back in a couple of weeks that they were "to sharpen picks. What do you suppose I want them for?" B—— has since emphatically denied this story.

* * *

M—— was washing out a pan of rich sand, etc., taken from the head box on his sluice line, and considerable gold was in sight when a shadow fell upon the pan. M—— looked up quickly and perceived an elderly gentleman with kindly face standing between himself and the sunlight, but did not like Diogenes order him out of his light while he bent over his tub; he bade him a cheerful good morning and remarked: "Did you ever see the likes of that? Do you see the gold?"

The old gentleman saw the gold and did not hesitate to acknowledge it. He expressed much interest in the contents of the pan and even a greater interest in the mine and its operation. M—— was a smooth talker and invited his visitor to dinner and did all he could to make his stay a pleasant one. So thoroughly did he impress the stranger that the latter was more than half inclined to make an offer for the mine. M——, however, did not urge the matter, but invited him to come up again the following morning and see the whole operation of stripping, shovelling in, cleaning up, etc. The stranger accepted his pressing invitation and agreed to come. M—— spent considerable time that night in judiciously salting his mine so as to impress the old gentleman with the possibilities of legitimate mining.

Agreeable to promise, the old gentleman was on hand early the following morning and stayed until noon, by which time six men had stripped, shovelled in and forked out an average of $10 apiece—a very good half day's work for four shovellers, one man on the box with fork and one man in the tailrace.

So much was the old gentleman impressed with the result of the work that he asked M—— to name a price, which M—— reluctantly (?) did, fixing it at $12,000. They went down to D—— and the money was paid over and M—— proceeded to celebrate the event in proper style. When he had recovered from the effects of his celebration, he thought he would go up the gulch and see how the old gentleman was getting along. He was greatly surprised to find that the old gentleman had made some radical changes. He had purchased the next claim below where there was a good fall and had cut a drain ditch some distance through a bed of local cement and was mining over the ground that M—— had called worked out. In explanation, the old gentleman said: "You see, Mr. M——, you were working on top of a local cement deposit—a conglomerated mass of gulch gravel cemented by iron from a spring just above here, and we are now working on the true bedrock; and when we reach the place where you were working, we will work both streaks. The lower streak on the true bedrock is much better than the one above. We get nearly $200 a day now on each shift."

M—— said to me afterward: "Just think of that, and I took him for a pilgrim!" MINER.

THE turbo-alternators of 1000 K. W. each are being constructed by Parsons for the lighting station at Eberfeld, Germany. These machines are said to be the largest ever made by any one.

AN additional 8000 square feet of space has been secured at the Paris Exposition for the United States, which will be devoted to a display of American bicycles.

The Occurrence and Origin of Diamonds in California.*

By H. W. TURNER, Washington, D. C.

It has long been known that diamonds are occasionally found in the gold placer deposits of California. Prof. J. D. Whitney and Prof. Hanks have recorded such localities where diamonds have been found as came under their notice. Prof. Whitney writes:

"The most interesting mineral found associated with the gold in the gravel of California is the diamond. This gem, as it would appear, is usually, although not universally, found in gravels which are washed or searched with care. Such gravels are chiefly those which are auriferous in character. Hence it follows that diamonds have been found in the surface detritus of most gold regions, as in Siberia, Australia, along the flanks of the Appalachain chain, and in California. * * * It appears that diamonds, like some other natural products, are widely disseminated over the surface of the earth, but are only present in considerable quantity at a very few points. Formerly, India was the productive region; then Brazil had its day, and now South Africa furnishes by far the larger portion of the new diamonds put upon the market. * * *

"The diamond has not been found in sufficient quantity anywhere in North America, whether in the Appalachian or the Californian gold fields, to be of much importance from an economical point of view. But from the methods pursued in mining in the latter region, it will be easily understood that but few of the diamonds actually contained in the detrital material washed would be likely ever to be seen. Still, the number of localities where this gem has been observed is considerable."

The following is a list of the occurrences as given by Whitney and Hanks:

DIAMOND LOCALITIES IN CALIFORNIA.

El Dorado County, near Placerville—	*Authority.*
South side of Webber Hill, several	Whitney.
White Rock Canyon, three or four	Whitney.
Dirty Flat, one	Whitney.
Smith's Flat, several	Whitney.
Amador County—	
Jackass Gulch, near Volcano	Whitney.
Rancheria, near Volcano	Hanks.
Loafer Hill, near Oleta	Hanks.
Nevada County—	
French Corral	Whitney.
Butte County—	
Cherokee Flat, 56 specimens	Whitney.
Yankee Hill	Hanks.
Trinity County—	
Trinity River sands (F. Woehler)	Hanks.
Del Norte County—	
Smith River sands	Hanks.

Recently has been received from G. W. Kimble of Placerville the following information concerning the occurrence of diamonds in his vicinity:

"Most of the diamonds were found between a point a little south of Smith's flat and White Rock canyon in river gravels. Ward & Co.'s mine is on the south side of White Rock canyon, where it had cut across the river beds. Cruson & Olmstead's claim adjoins theirs on the south and is known as the Unity mine."

Mr. Kimble also states that nine more diamonds have recently been found in the vicinity, mostly from the Unity mine, and that a great many diamonds have been crushed in the gravel mills, for he has frequently examined the concentrates of the mills and found in them fragments of diamonds often so small that they could be determined only by the aid of the microscope. Still more recently (1898) Kimble reports having examined a diamond found within the limits of the town of Placerville, in Cedar ravine, a tributary of Hangtown creek.

J. A. Edman reports two localities of diamonds in Plumas county. He found a few in the black sands at Gopher hill, the largest one being $\frac{1}{10}$ of an inch in diameter, and on upper Spanish creek in a sand rich in heavy minerals he found two. The Gopher hill locality is in Sec. 7, T. 24 N, range 9 E, and the Spanish creek locality is in Sec. 10, T. 24 N, range 8 E, Mt. Diablo meridian.

G. F. Kunz refers to the finding of two diamonds recently by W. P. Carpenter near Placerville, the larger one of a greenish shade and the smaller pale yellowish, and each nearly $\frac{1}{4}$ of an inch in diameter. Mr. Carpenter proposes to work his section of the channel by other means and avoid the possible loss of diamonds of more value than the gold. The same writer notes the finding of a small diamond on the banks of Alpine creek in Tulare Co., Cal., by L. W. Hawkins, and of five diamonds near Oroville in Butte county, and as many more at another locality, suggesting a peridotyte origin.

The California diamonds thus far found are mostly of small size. One found at Rancheria was of a pale straw color and weighed 225 milligrams. A diamond is in the collection of the State Mining Bureau at San Francisco. This was found at Cherokee. One of the diamonds found at this place is said to have been valued at $250. A diamond found at Yankee hill is said to be owned by Mrs. J. Bidwell of Chico.

The known occurrence of diamonds in South Africa in serpentine suggests a similar origin for the California finds. If we take the geological maps of the gold belt published by the U. S. Geological Survey we will find that there are serpentine masses near all of the localities above reported in the Sierra Nevada. There is no serpentine in place in the gulches in which diamonds were found near Placerville, but Kimble reports that serpentine pebbles were frequent in the diamond-bearing gravels. These serpentine pebbles may easily have come from a point about 6.5 klms. east of Placerville.

It would be interesting, in view of the above facts, if the local gravels of gulches lying entirely in serpentine could be carefully washed and all of the heavy minerals saved and examined. The finding of diamonds in such gulches would strongly suggest that serpentine is the mother rock of the California diamonds, and this might lead to economic results of local importance.

The year 1897 was remarkable in the history of diamond literature for the appearance of three important publications, by De Launay, Lewis, and Crookes. De Launay describes the serpentine of the Kimberley mines of South Africa as being derived from a peridotyte determined by Stelzner as a picrite-porphyry. Mixed with the serpentine are abundant fragments of various rocks, so that many specimens are of the nature of a contact breccia. These serpentine bodies occur as pipes or plugs extending down nearly vertically to an unknown depth. The general shape of the section of each pipe at the surface is round or oval. In following the volcanic plugs down it has been proven that each one passes through several formations. At the surface the enclosing rocks are carbonaceous shales, and at one time it was believed that the carbon composing the diamonds was primarily derived from these shales, and when the excavations passed through the carbonaceous shale it was feared that diamonds would no longer be found. Underlying the shales is a bed of diabase. The serpentine at this horizon still contained diamonds as before. At the present time the excavations or shafts at Kimberley and De Beers have gone through the diabase horizon and the miners are now engaged in working the volcanic pipes in the underlying quartzites. De Launay states that the enclosing terranes have had no influence whatever either on the quantity or the quality of the diamonds. These have incontestably come from below with the peridotyte breccia. The idea that the carbon of the diamonds came from the upper carbonaceous shales is thus disproven. Moreover, there are very numerous volcanic chimneys of the peridotyte (kimberlyte) in South Africa, and not all of these contain diamonds, while some contain them only rarely or of microscopic sizes.

(To be Continued.)

* From the American Geologist. Published by permission of the Director of the U. S. Geol. Survey.

IT is a question how soon or to what extent the copper ore of Butte, Montana, turns into iron. The percentage of copper in the Butte mines is reported to have been steadily decreasing and the percentage of iron increasing until at the present time a large part of the copper of Butte is simply a minority of mineral extracted from iron ores, but the iron ore furnishes a cheap flux. In recent litigation between the Montana Ore Purchasing Co. and the Boston & Montana, experts testified that there was a large body of iron ore between the 1600-foot level and the 2000-foot level, but that below the 2000-foot level a higher grade copper ore would come in than was the grade of copper ore above the iron belt. In the Green Mountain of the Anaconda group a diamond drill has been sent down below the 2000 level, encountering rich copper ore.

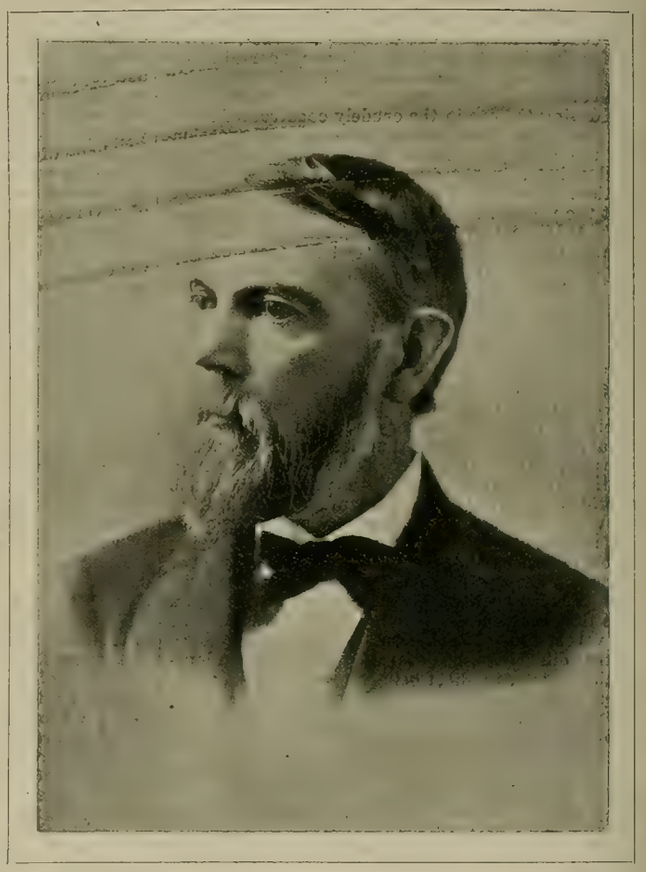
THE California Water and Forest Society proposes to hold a great convention in this city soon, to advance the effort to conserve the waters of the State. The executive committee recently met and a general discussion was had as to the surest means of getting the sentiment of the people at large in regard to the best plan to utilize the waters of the State, when and where needed, in order to bring about the conservation of the watersheds and forests. Finally President Gleaves appointed a committee of five to meet with representatives of the commercial, mining, farming and other interested bodies in the State, and arrange for a State convention. The purpose of this convention will be to induce the State to appropriate sufficient funds for the construction of impounding reservoirs. Should the State fail to pass needed legislation then the convention will devise ways and means to bear the expense.

Death of A. T. Dewey.

The older readers of the MINING AND SCIENTIFIC PRESS will hear with sincere regret of the death of Alfred T. Dewey, which occurred at his residence in Oakland on May 24th.

Mr. Dewey was born May 4, 1834, at Westfield, Mass. He learned the trade of printer in his native town and in 1852 was associated with his surviving brother, E. M. Dewey of Tulare, in the publication of both weekly and daily journals in Westfield and Springfield. In 1856 Mr. Dewey came to California and purchased a half interest in the *Mountain Messenger* at La Porte, at the time a rich mining center, and later became sole proprietor of the paper. In the fall of 1863 he purchased a half interest in the MINING AND SCIENTIFIC PRESS, and published the same in partnership with W. B. Ewer, under the firm name of Dewey & Co. Mr. Dewey was also a partner in the Patent Agency, which bore the same firm name. From 1863 until the incorporation of the Dewey Publishing Co. in 1891 Mr. Dewey gave his personal and unremitting attention to the conduct of this journal, calling to his assistance the best help he could secure by intelligent selection and generous remuneration.

In 1892 Mr. Dewey's interest in the journal ceased by sale of his share of ownership to other parties and during the remaining years of his life his attention was given to the affairs of the Dewey Engraving Co., which he had previously organized and of which he was sole owner. Mr. Dewey was the pioneer on this coast in the direction of photo-engraving, as he introduced the process in 1877 as the result of his faith in the method instilled by his study of its beginning at the East during his attendance at the Centennial Exposition at Philadelphia.



THE LATE ALFRED T. DEWEY.

Mr. Dewey was a resolute believer and promoter of fraternal organizations and maintained membership in several leading societies of this class until his death. His funeral in Oakland on May 28th was under the auspices of these bodies and was a fitting token of respect to his memory.

Such in briefest outline is the record of the public life of Alfred T. Dewey. The most striking characteristics of his life were the sincerity of his motives, the clear integrity and honor of his intentions, the loftiness of his ideals and aspirations and the exceptional generosity of his purpose.

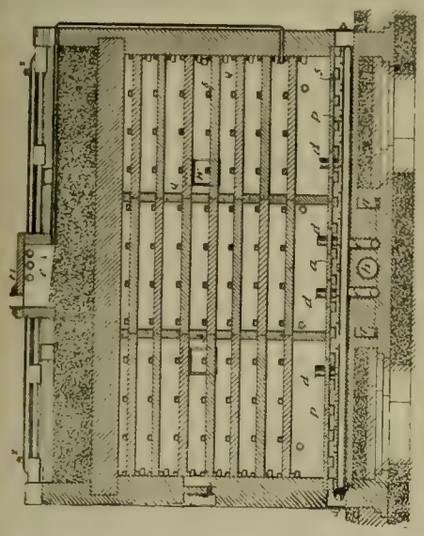
To the bereaved family the sympathy of friends everywhere will come as new testimony to the worth of him whom they have lost. To Mrs. Sarah H. Dewey, who since 1861 has upheld his hands in all earnest work and shared his fortunes with wifely tenderness and self-sacrifice, the most earnest condolence will come. For her and for her son and daughter there remains the welcome duty to cherish the memory of a man who deserved well of the State.

Latest Mining and Metallurgical Patents.

Patents Issued May 23, 1899.

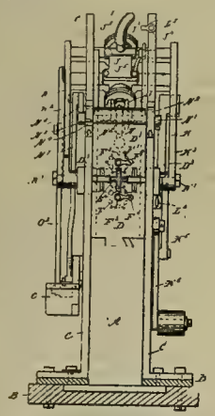
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

WHITE LEAD CHAMBER.—No. 625,196; H. G. Percival, London, England.



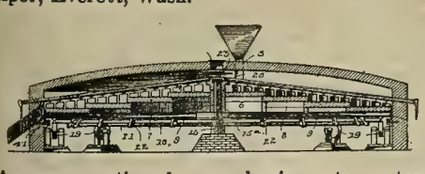
A chamber for the manufacture of white lead, having an air space beneath floor and air spaces, communicating therewith, in walls, heating means for air in spaces, a mixing chamber for air and carbonic anhydrid beneath floor, communicating with interior of device, air conduits leading through walls of chamber, communicating from outside with interior, and with spaces in walls, means for controlling passage of air through conduits, and valved discharge pipes leading from interior of chamber.

MACHINE DRILL SHARPENER.—No. 625,140; J. J. Brossoit, Butte, Mont.



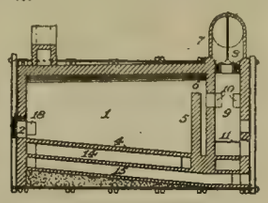
A drill sharpener, comprising a pair of swages for engaging the shank at opposite ends, one of the swages having a reciprocating movement, a reciprocating end swage at an angle to the pair of swages, and a cylinder mounted to swing and having a reciprocating piston arranged for connection with either of reciprocating swages; a drill holder, a reciprocating swage for sharpening the end of the drill, a cylinder mounted to swing and having a reciprocating piston adapted to be connected with or disconnected from the end swage, and mechanism operated by the movement of the cylinder for locking and unlocking the drill holder; a reciprocating hammer and a swage formed with sharpening recesses for engagement with the end of the drill to sharpen the same, the said swage being adjustably held on the end by the hammer and provided at its top with a flange extending over the top of hammer and a screw rod turning in flange and screwing into hammer.

ORE ROASTING FURNACE.—No. 625,336; J. F. Keiper, Everett, Wash.



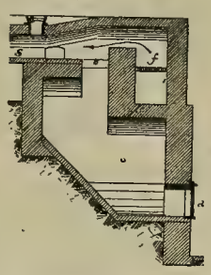
An ore roasting furnace having rotary stepped hearth, means for depositing material upon and receiving same after roasting operation from hearth, a feeding device for advancing material upon hearth from the point of deposit to the point of discharge, means consisting of a series of blades, disposed diagonally with relation to a radial line of hearth, and in operative relation with the several steps of hearth surface, and a radial spindle, supporting a plurality of blades, mounted for revoluble movement to provide for swinging blades toward and from the surface of the hearth; furnace having a rotary hearth stepped downwardly from its center toward its periphery, and having central spindle extending above and below plane of hearth with its lower end mounted in a suitable bearing, ore depositing and receiving devices located respectively contiguous to the center and periphery of the hearth, a cap having an anti-friction bearing upon the upper exposed extremity of the hearth spindle, a refractory sheath inclosing portion of hearth spindle below cap.

METALLURGICAL FURNACE.—No. 625,367; W. Swindell, Pittsburg, Pa.



A metallurgical furnace, the combination of a heating chamber, means for applying heat from gaseous fuel thereto, a system of tortuous waste flues extending alternately forwardly and rearwardly in a horizontal plane beneath floor of heating chamber and communicating at opposite ends so as to admit of traverse in opposite directions of outgoing waste products of combustion beneath floor of heating chamber, and a corresponding system of horizontal air admission flues underlying water flues, and communicating at opposite ends so as to admit of traverse, in opposite directions, of incoming air beneath the walls of waste flues; combination of a heating chamber having a charging opening and door at one of its ends, a bridge wall at opposite end of chamber, an air inlet, a gas supply chamber provided with outlet ports adjactent to bridge wall, a valve-controlled gas conduit leading into chamber, a grate in lower portion of gas supply chamber, a fuel opening and door and an ash pit opening and door in wall of the gas supply chamber above and below grate respectively, vertical flues for the reception of waste products of combustion at end of furnace adjacent to charging opening and door.

PROCESS OF CHLORINATING ORES.—No. 625,397; W. B. Jackson, Pueblo, Colo.

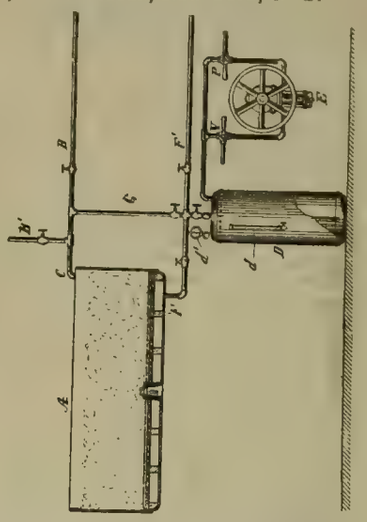


Process of chlorinating ores, which consists in roasting the ore under low heat, adding to heated ore a chlorinating material consisting of a sulphide ore and salt, continuing heat at a bright red, allowing chlorinating fumes to attack ore, and thereafter allowing mixture to cool while in chloridizing fumes.

HAMMER HAND SLING.—No. 625,469; H. H. Schepers, Sandon, B. C.

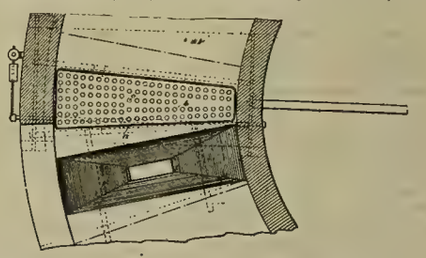
A hammer hand sling for retaining a hammer and relieving the hand at intervals from grasping the handle while striking an upward blow, comprising a U-shaped clutch to fit the hammer handle, a strap having the ends fastened to said clutch and forming a loop to receive the head of the hammer, a buckle connected to said clutch and a strap passing through said buckle and forming a loop to fit on the wrist of the user.

PROCESS OF TREATING GOLD OR SILVER ORES AND COMPOSITION OF MATTER FOR SAME PURPOSE.—No. 625,564; E. D. Kendall, New York, N. Y.



Process of treating ores or other bodies for the extraction of precious metals, which consists in treating them with an aqueous solution containing a thiocyanate and a ferricyanide; composition of matter, to be used for extracting precious metals from ores, tailings, or other bodies, consisting of a suitable thiocyanate and a suitable ferricyanide in watery solution.

COOLING ATTACHMENT FOR ORE-ROASTING FURNACES.—No. 625,608; J. E. Rothwell, Boulder, Colo.



The combination with an ore-roasting furnace, the flat hearth thereof and means to discharge the ore from such hearth, of the herein-described ore-cooling attachment, arranged at the discharge of such hearth and with entrance level with the floor of hearth, and comprising shell or casing a containing a series of tubes which open at both ends outside of said shell and through which tubes the ore passes by gravity as it is fed thereto, and means to circulate the cooling agent, such as water, through such shell or casing and around the said tubes.

PROCESS OF TREATING SULPHURETED ORES.—No. 625,432; M. Body, Brussels, Belgium.

The extraction of metals from refractory sulphidic ores or minerals, the process which consists in converting the metallic sulphides in the ore or mineral into polysulphides by means of heat in presence of carbon and of an alkali metal salt, washing out the polysulphides and treating alkaline polysulphides solution without destroying its alkalinity, with a suitable precipitant to precipitate therefrom all of metallic sulphides except those of arsenic antimony and tellurium. In process of treating sulphureted ores of a complex nature, comminuting and melting ore in presence of an alkaline salt and carbon, whereby alkaline polysulphides soluble in water are formed, plunging melted mass into water, whereby a magnetic precipitate is formed and the polysulphides dissolved in the water, separating the solution from the precipitate, subjecting same to action of air and sulphurous acid gas forced thereinto, whereby monosulphides of iron, together with the precious metals, are precipitated, maintaining the alkalinity of the solution during the operation of precipitation by addition of an alkaline substance, as lime, separating the solution from the monosulphide of iron precipitate, extracting from latter copper, and then precious metal, and separating arsenic and antimony from solution by precipitation.

PROCESS OF TREATING GOLD OR SILVER ORES AND COMPOSITION OF MATTER FOR SAME PURPOSE.—No. 625,565; E. D. Kendall, New York, N. Y.

Process of treating ores or other bodies for extraction of precious metals, which consists in treating them with an aqueous solution containing a thiocyanate and hydrogen dioxide; composition of matter to be used for extraction of precious metals from ores, tailings or other bodies, consisting of a suitable thiocyanate and hydrogen dioxide in watery solution.

Water Development.

By THEODORE S. VAN DYKE.

The coming summer will see more water development south of Tehachapi than any two seasons of the past. Much of it will be solid and permanent addition to the resources of the section. Much more will be of merely temporary benefit, but still well worth what it cost. Considerable more will represent disappointment either sooner or later. How to avoid loss of time and money is the principal question that is of much practical value, and is also the hardest question to answer.

Old River Beds.—From the time when our mountains were several feet higher, and the streams leading from their bases were several hundred feet below the present level of the wash and drift that has formed the soil of the valleys and slopes, the streams have shifted their channels so many times that it is quite impossible to tell where they now are, or what their number. Many are miles from the present bed of the stream, while the chances are against any of them being exactly under the present bed, because the range of most of the streams from side to side has been so wide.

Equally impossible is it to say how large they are, or what the amount of water they carry, or how long it will take to run it out if heavily drawn on. Some one has had the audacity to frame a formula for computing the flow of water underground. But there is nothing in hydraulic engineering that justifies anything of the sort. In the dozens, and even hundreds, of old channels that the shifting of the streams and covering of the old beds with drift have made, the gravel or sand through which the water is now flowing, between two layers of clay or concrete, varies so much in the size of the grains, in the amount of fine material lying between the grains, as well as the character of the inlet and outlet to the sea, that nothing approaching a rule should be given, even if we knew the size of the channel and its exact slope. In short, the only way to develop water is to develop it.

Natural Reservoirs.—There are, however, certain principles to be borne in mind, or you may find trouble ahead, although it may not be immediate. First, all development is drawing on a reservoir. If you have an artesian well, or one in which the water rises much above the level on which it is first struck, you have a reservoir in which the dam is generally friction instead of masonry. But it is none the less a reservoir. Too many taps cannot be made in it, nor can too many be left open. Much of the development made this year will represent pockets or channels of water connected with the source of supply by some small tread of gravel through which water moves very slowly. If exhausted it may take a long time after the next wet winter to fill them again. In many cases the very fact they are now full shows that they have no outlet to the sea. From this it is quite easy to understand how the inlet to them may be very small. For if it were very large the channel would probably go clear through to the ocean. The expression "inexhaustible well" has become quite common. But all wells are inexhaustible as long as you do not exhaust them. The test will come after many weeks, months or even years of pumping, when you have planted your orchard or alfalfa and expanded out on the strength of the new supply. Many developments will stand it, but it is quite as certain that many more will not.

Supply for Wells.—In case of wells, which will be the principal means of development, keep a careful record of the material passed through, so that you will know whether you are on gravel channel which is probably a stream, or only in a sponge which will feed the well by seepage. Seepage is unreliable for heavy and continuous work. It may do for the windmill, but generally the engine that is throwing much of a stream must be on an underground stream or a few weeks, or even days, may find the bottom of the well dry soon after the engine starts up. At first the well fills readily when pumped out, but a cone or depression forms around it as soon as the pump begins. At first the sides of this are steep and when the pump stops the water soon fills it to the general level of the stratum of water in the sand or gravel. Day after day the edges of this cone spread further away from the well, the slopes forming the sides become longer and more nearly a level. The water having further to travel through a resisting material, comes in more slowly, while the general level of the stratum of water is constantly falling to the level of the bottom of the pump. Once down there it may take several weeks, months or even years to fill again. The time cannot even be guessed at, for you know nothing of the mode of supply, and perhaps not even its source. Such is quite certain to be the case with wells sunk in decayed granite if a heavy draft is made on them. Even though the water comes in from crevices they cannot long be depended on.

Passage of Water Through Fine Material Very Slow. Springs in the hills that flow without weakening for at least seven months after the last rain and yet where it is much less than a quarter of a mile in any direction to the rim of the watershed from which you can readily see they must come. It is much the same, and often worse, with water passing through soil, and even through pure sand it is provokingly slow. No one can calculate its rate of progress, but you can generally rely upon its being provokingly slow when you need much water. If it were otherwise few of our supplies would hold out after one dry year. People love to flatter themselves that the water comes from some distant source, independent of the watershed about the well. If in a well-defined gravel channel this is generally the case, and most wells in such formation are reliable under very heavy draft. But if in soil, or decayed rock, the presumption is heavily the other way, and even sand is often a mere sponge for a local watershed. Even where it is certain that it is not, I have found the passage of water through it so slow that a well 20 feet across pumped down from 8 to 2 feet took one hour to regain 1 foot with the water standing at the 8-foot level all around it. This was a foot an hour under an average pressure of 5½ feet. No one can say what it would have been under no pressure, but with the grade of the stream 25 feet to the mile.

A mile and two-thirds a year is quite slow under a pressure of 5½ feet, even for fine quicksand which this was. Yet I measured and timed this well myself as soon as the pump stopped, and could not have made more than 5% error at the most. Through most sand water will pass more rapidly under that head, yet you are liable at any time to be greatly disappointed in its velocity. Wells in soil, soft rock, and fine sand will do for a light supply, and also to help out in bad seasons, but should not be made a basis of further expansion in planting until time has proved what they will do. The only danger in the present great developing movement is the cry "Eureka." Too many may think they have solved the great problem only to find what may be valuable as a reserve will not stand the brunt of steady battle.

Gravel Channels.—Strange as it may seem a gravel channel in which the water does not rise in the pipe may be a more reliable source of supply than one where it does. Where pressure is indicated by the rising of the water above the top of the stratum in which it is struck, it means resistance all the way back to the last thread of water that feeds it below ground. If this resistance be removed by opening the channel by wells, and drawing out the resisting water, the supply is quite apt to come in much faster than when the resistance of the water below aided friction in holding it back. Consequently too many taps on an artesian belt may seriously reduce it by accelerating the feed of water from above. But where there is no pressure the flow from above cannot be accelerated by taps below. There may be wells enough in it to take in all, but they cannot hasten the end as in the other case. As this is contrary to common belief, even of many good engineers at first glance, you will find it of much interest to consider this carefully, especially in view of its possible importance.

Underground Riparian Rights.—In the case of Yarwood vs. The West Los Angeles Water Company it was proved beyond question that the water in wells some 1200 feet above the development cut fell some 4 feet about the time the main cut was made, and some 16 inches while an extension was being made. This was not denied, and could not be, for it was found on examination of the wells that it was true; it was from failure in the supply and not from the draft made by the cut. The other engineers in the case took the same view and the case was won by the company on that ground. Had the water been a still sheet it could have been lowered, but in that case it would have been percolating water, and the owner of the land (the company) would have a right to it, even to the damage of another. To maintain this case plaintiffs had to claim as upper riparian owners on an underground stream, and the court found that it was such a stream, although in the form of a moving sheet. But being in motion on a grade, instead of standing on a level plane, it became instantly subject to the laws of water flowing against resistance without regard to its form, depth, velocity to fall.

How Resistance Holds Water. — One of the most simple of these laws is that water flowing against resistance will, by that very resistance, be held up to a certain plane. If so, it cannot be lowered below that plane as long as the resistance is there. The illustration given in court was that of a flume carrying 100 inches of water. It will flow full to a short distance from the end, where it will drop off in a curve. This curve cannot be extended back of a certain point by any mode of facilitating the discharge. You may break off section after section, or widen the outlet as you please, but the curve quickly stops. No matter how short the flume you cannot carry it back the whole length, for if you could the flume would carry more than the 100 inches. It would not be long enough to be a real flume.

Suppose, now, we fill the flume with gravel until it carries only 1 inch of water. We still have the results. The curve at the end is changed some by the character of the resistance of the gravel, but it is still there. The flume runs full as before to near the end, and then curves suddenly off. By no way of assisting the discharge can you increase it so as to carry the curve back of the point where the resistance has located it. If such assistance could lower it for the whole distance, it would then carry more than 1 inch. But its capacity is now reduced to 1 inch by the resistance, and that resistance necessarily holds the water up to the top of the flume.

As Applied to Artesian Wells.—You cannot avoid this conclusion except by jumping the terms of your own proposition. The consequence is that you cannot, in this way, reach the source, and therefore cannot lower all the water plane as long as the supply lasts. The hydraulic curve formed by the lessening of the resistance at the end will vary with the character of the material, but in no case can it run back very far. In the Yarwood case we bored some fifty wells to test the theory, connected them all by the level, and plotted the results. The curve ran out entirely in 300 feet or over 900 feet below the land of the plaintiffs, showing that the lowering of the wells must have been due to failure of the supply far above. This was further shown by the fact that the area over which the lowering occurred would have doubled the flow in the cut for several weeks had it all gone out that way. But there was no increase in the flow over that which continued for many months thereafter, and the plaintiffs, though living where they could readily see and measure any such increase, did not attempt to show any. The sheet of water in this case rose again 300 feet below the cut and moved on as if nothing had happened, the supply evidently coming up from below at that point.

The consequence is that several wells may be bored into such a stream not under pressure, and if not too close, so that one comes within the cone of depression formed by the other, each may get its share of the water without damage to the supply, which would pass away to the sea if not thus taken. But if under pressure, the same number of taps would probably increase the flow between the upper well and the mountains, so as to let out the supply much faster. Thus a stream not under pressure may be a safer supply than one under pressure, though it may cost more to raise the water.

Zinciferous Ores at Leadville, Colo.

Written for the MINING AND SCIENTIFIC PRESS.

A great tonnage of zinciferous ore exists on numerous Leadville dumps and large bodies of it are available in many of the well-developed mines of the district. The increasing demand for spelter at higher prices is creating an active interest in the subject of mining and shipping this class of ore from Leadville. The proposition to establish zinc smelters here is met with the assertion that these ores should be shipped to the source of fuel supply rather than to ship fuel required in their smelting to Leadville; that each ton of zinc ore requires from 2¾ to 3½ tons of coal to smelt it.

R. R. Moore of the St. Louis Smelting & Refining Co. has given the subject here some attention and is reported as being favorable to the belief that zinc smelting may become a successful industry in Colorado, notwithstanding the fact that the presence of iron in Colorado zinc ores is detrimental on account of its corrosive action on the retorts. The Leadville *Herald-Democrat* gives the following condensation of Mr. Moore's description of the standard zinc smelting process:

"The crude ore is crushed to about 12-mesh size and then thoroughly roasted until desulphurization is complete. The desulphurized product is then mixed with about 30% coal and retorted in small retorts. These latter are about 4 feet long by 8 inches in diameter, and a large furnace has as high as 800 of them. The carbon of the coal in the charge reduces the zinc to metal and the metallic zinc, at the high temperature required, being volatile is condensed in another pot outside of the furnace."

Recent shipments of zinc ores from Leadville to Antwerp and Swansea have been made, the result, it is claimed, being to demonstrate that ores running as high as 45% zinc, with only a small per cent of iron, can be shipped from Leadville to points abroad at a profit.

The New Jersey Zinc Works, whose plant is at Mineral Point, Wis., have purchased the Colonel Sellers mine at Leadville, which is a large zinc producer, and it is reported here that the purchasers intend working the mine and shipping its zinciferous ores to their plant at Mineral Point.

WORK has been commenced by the Telluride Power Transmission Co. of Provo, Utah, to double the capacity of the Provo Canyon plant, adding 2000 more H. P. for use in the Tintic district. L. L. Nunn, the president of the company, thinks that power can be turned on the new route in about sixty days, and as soon as it reaches the Tintic district there is assurance of good patronage. Mines in which Provo parties are interested will likely put in electric power.

The Old Telegraph Mine, Utah.*

By G. LAVAGNINO, Salt Lake City.

The recent reopening of the extensive group of mines of which the Old Telegraph is the central figure gives more than a passing interest to a geological description of the property at this time.

The Old Telegraph mine lies on both sides of Bear gulch, a short branch of Upper Bingham canyon, and nearly in the center of the group of mines called the Bingham mines, about twenty-seven miles southwest of Salt Lake City. It is considered by local miners as the most important mine of the district.

The geological formation consists of Weber quartzites, with subordinate conformable limestones and shales, alternating with porphyritic rocks. These widen toward and connect with the massive backbone of the Oquirrh mountains, while the quartzite develops itself on the slope broken through by Bingham canyon.

The porphyry not only runs between the strata, but also cuts across them, isolating large portions near the mountain mass, and again on a smaller scale it penetrates some joints in the quartzite. It is a crystalline felspathic rock, containing variable portions of quartz, mica, hornblende, chlorite, and iron pyrites as accessories. In places, it takes a less distinct or almost uniform fine-grained structure. It has a gray or greenish, and, when much altered, also a reddish or even white color.

The quartzite is a fine-grained or almost compact grayish-white or bluish or reddish quartz rock, containing in places fine scales of mica and grains of iron pyrites as accessories. The raised, folded or broken masses show well defined bedding joints, and their general dip is 35° to 50° towards north or northwest.

In the porphyry occur metalliferous veins with a prevailing N.E.-S.W. strike. These are in general narrow veins; their principal contents are not dissimilar from those of the other deposits; but there is considerably less oxidation near the surface and the ore is mostly richer in silver.

In the quartzite the ore deposits generally occur on the joints of bedding. The more important deposits occur either in clearly defined contact veins, or, more often, in somewhat vaguely defined mineralized zones, that could be called contact zones. These comprise several masses of more or less altered or decomposed rocks and the newly distributed products of their mechanical and chemical decomposition, such as breccia and clay in seams or in more irregular bodies.

These zones are more definitely limited beneath by a bed of hard quartzite upon which they rest, than on the opposite side by limestone or porphyry. White, fine-grained limestone remains near the surface in isolated benches only, and in the upper part of the Old Telegraph mine it is almost absent. Porphyry makes a more continuous limit, not only as a roof, but also often terminally.

The ore bodies in these zones are very irregular. Although they are generally lenticular masses lying flat with the strata, they occur also in different forms and positions, and often they are connected by narrow channels, veins or threads. When an ore body, as in the more frequent case, occurs in soft ground, there is often in immediate contact with it a local slickenside, commonly called a hanging wall; but similar polished joints occur also through the ore body. The country rock is not always clearly distinct from the ore proper; more frequently it is more or less impregnated next to the ore, or even transformed so far as to be worth mining as ore. This is especially the case in the upper parts of the mines, in the regions of the oxidized ores, which have been hitherto the more important in this district.

In a very wide sense, the more important group of mines, extending from the Wasatch and Lead mines on the east to the Jordan and Stewart mines on the west, can be considered as belonging to a single mineralized zone or belt, although portions of it may appear isolated by porphyry as above described, or by the later phenomena of erosion, which play an important part in this district, as attested by the existence of placers and of conglomerates in the canyon and in the gulches. Very likely, all these deposits have a common genesis with those of the Old Telegraph mine.

At this mine there are large, irregular bodies of more or less silicious pyrites, transformed within in the limits of oxidation into more or less ochreous, spongy and brittle quartz, and into more or less silicious yellow, red or black ochres. In or near these pyrite bodies, and also wholly apart from them, occur smaller bodies of galena, with fine-grained zinc blende and iron pyrites, corresponding to the bodies of carbonated lead ore within the zone of oxidation, which have furnished the main production of this mine since its discovery.

The distribution of silver and gold is very irregular; the main part of the ore is of low grade, while in smaller pockets the yield is considerably higher. The pyrite is of very low grade, that most free from quartz containing only five or six ounces silver and less than $1 gold per ton, although better samples both in silver and in gold can be obtained. In places it carries a little copper. The pyrite occurs both crystallized and massive. The "base ore," generally coarse-grained crystalline galena, with fine-grained zinc blende, contains about twice as much silver as the pyrite.

The more or less spongy quartz above mentioned (the old matrix of pyrite) contains always a little silver and gold, mostly little more than the pyrite. In some places it carries ten to twenty ounces of silver per ton, and in exceptional spots much more. Most of the silver and gold is contained in the small amount of ochre adhering to and coloring the quartz. Perfectly white, spongy quartz is poorer; some of the best quartz is gray. The more or less silicious and argillaceous ochre, usually extending into the country rock, is of no practical value, unless it passes over into lead ore proper.

The lead carbonate ore is a more or less silicious, ferruginous and argillaceous lead ore, colored yellow, red, light or dark gray, containing as accessories pieces of "free" galena—that is, galena free from other sulphurets. It carries mostly ten to twelve ounces of silver and about $1 gold per ton. This yield is often raised by the presence in the ore body of small veins of soft quartz, richer in silver and gold.

The above-mentioned types of ore are not always clearly distinct. There are transitions; and the country rock next to the ore may be more or less impregnated with iron oxide and lead carbonate. The practical distinctions are between first-class lead ore or smelting ore, second-class lead ore or concentrating ore, and silver and gold ore. Pockets of true silver and gold ore (a brittle, sandy quartz with white or yellow clay) occur indeed in position even independent from the lead ore, and appear to be a more recent production in the upper levels of the mine.

The Old Telegraph mine was first discovered by prospecting near the top of the ridge, east of the gulch, on the outcrop of some bodies of lead ore, and it has been opened and worked by adits or tunnels on both sides of the gulch, most of them originally driven to prospect separate mining claims. The gulch represents a large natural gap in the ore-bearing ground; it abuts on the quartzite south limit of this ground and crosses a belt of porphyry north of it.

The connection between some of the ore bodies has been proved in several cases, and in one particular instance this connection has been traced for several hundred feet, between the ore bodies discovered near the top of the hill on the east and other ore bodies discovered by lower tunnels. A similar relation exists on the west side of the gulch.

The ground is generally soft and needs timbering. The largest stopes were timbered by "square sets." Most of the openings cave, unless their timbering is expensively kept in repair.

The first-class ore was either smelted at the Old Telegraph furnaces in West Jordan, near the Jordan river, about ten miles south of Salt Lake City, or sold on the market, The second-class lead ore was concentrated at the Old Telegraph mill in West Jordan, or at a similar mill in the canyon. Some of this ore was first lixiviated by filtration with hyposulphite of soda, to extract a small portion of the silver, and then concentrated. Some good and some poor silver ore was lixiviated with hyposulphite of soda in a small mill at the mines.

The mechanical concentration presents two difficulties, which are especially notable when the ore is higher in silver and gold—namely, the silicious tailings carry off several ounces of silver per ton, and the slimes much more. These slimes usually contain more silver and gold than the concentrated ore, and they cannot be successfully concentrated. They hold most of the ochre contained in the ore, and with a little care they can be kept free from the very fine sand which tends to follow them. But for their fineness, they would be a desirable smelting material. The plan adopted when all the works were running—that is over twenty years ago—was to collect the slimes and to combine with them the flue dust and make bricks ready for smelting.

The problem of the future lies in the utilization of the low-grade pyrites and base ore, and low freight rates and economical concentration are the first steps towards its solution.

*Condensed from Transactions of American Institute of Mining Engineers, '87.

Chloride of Zinc.

A curious by-product of zinc is chloride or salts of zinc, which formerly went to waste, but now is used as a wood preservative by railroads, bridge builders and dock builders, and for the protection of shingles, clapboards, and any other wood that is exposed to moisture or influences that cause decay, says the Chicago *Record*. The salts of zinc, in solution, by hydraulic pressure are forced into the pores of the wood, which is then soaked in a solution of tannin and glue. The ties and piling now used on the Santa Fe and Southern Pacific and other Western roads are treated in this manner. The railway companies named use from 3,000,000 to 4,000,000 pounds a year each. With this treatment a pine tie, which is the only kind that can be found out in the mountain country, will last three times as long as one of oak.

Characteristic Mines of the California Gold Belt.

Written for the MINING AND SCIENTIFIC PRESS.

The peculiar characteristics of the great dolmitic vein, which is such a prominent feature of the southern portion of the so-called mother lode, in the central part of the gold belt, are no better shown anywhere along its length, perhaps, than at Coulterville and vicinity. Just below the village, on Maxwel. creek, the great vein crosses that stream, which has cut a gap through it about 100 feet wide. On the south side of the creek is located the Louisa mine, and immediately north of it is the Margaret, on the opposite side of the creek. Where the lode crosses the creek it has a width of 300 feet, and consists of an immense mass of ankerite, through which is disseminated the green, scaly mineral mariposite. Large, lens-shaped masses of quartz outcrop boldly from the ankerite, being somewhat harder than the latter. The lenses are irregularly distributed, but occur mostly along the hanging wall and near the center of the vein. The large veins or lenses of quartz are separated by equally large or larger zones of the dolmitic mineral, which is interlaced in every direction by quartz veinlets and veins of varying size, making the entire mass a mineral zone or lode proper. One of the quartz lenses is nearly 20 feet in width, outcrops to a height of 25 feet and is 300 feet long. A shaft sunk on the foot wall side of it to a depth of 60 feet showed it to be thinning out; but there is no doubt that it would be found replaced in depth by another lens of similar character. South of this large cropping a small vein branches out into the hanging wall, which is diabase, striking northward and increasing in width until it disappears underneath Maxwell creek. On the opposite side of the stream a large vein appears, which apparently is the northward continuation of the one referred to.

Through the center of the lode is a quartz vein 10 to 20 feet in width, and still west of it another, but smaller, vein. The entire western portion of the ankerite mass, constituting about one-third of the whole width of the zone, is a perfect network of small quartz veins, stringers and bunches of quartz.

A prominent feature of interest is the union of two of the largest quartz lenses near the center of the lode by a third large vein, which crosses the intervening ankerite diagonally. The two large veins are about 120 feet apart. Beginning near Maxwell creek, on one of the large outcrops referred to, a careful examination discovers a seam in the quartz, along which gold may be seen almost every foot of the way. This gold seam can be followed some distance in a southerly direction to where the diagonal branch above referred to leaves it. This latter also shows gold along a similar seam, leading to the other large quartz lens parallel with the first, and here, again, is a gold seam which may be followed if care be taken. Outside of the gold thus occurring, none was observed elsewhere by the writer, though it was said that prospects could be obtained by crushing certain portions of the rock and carefully panning it. Southward from the section above described, the several large veins converge toward a central point on the ridge, which rises higher and higher, terminating in an immense mass of quartz at its apex. Southward from this point the quartz is less prominent and the ankerite constitutes the major portion of the lode until another occurrence of quartz lenses is reached, which in each case, whether following the lode north or south, is much the same.

Gold sometimes occurs in the ankerite and mariposite, when seamed with quartz. A brecciated, crushed condition of this rock seems to favor the gold, or, at least, rock of this character contains more gold than that which is massive and solid. The entire mass is low-grade, and ankerite wholly free from quartz is practically free from gold in this mine.

The hanging wall country at these mines is massive diabase, and the foot wall a diabase dyke, separating the ankerite lode from the black clay slates of the mariposa beds. These latter are a mile wide and are intruded in numerous places by dykes of diabase and diorite.

The next prominent outcrop on the lode northwesterly from Coulterville is at Pinon Blanco, about three miles distant. This hill rises prominently, its larger axis lying with the lode and being defined by conspicuous outcrops of quartz similar to those at the Louisa. The country rock at Pinon Blanco is somewhat different from that at the Louisa. At the former a coarse gabbro is prominent, some crystals of pyroxene in semi-decomposed rock masses being 2x3 inches in width and length. Serpentine is also in contact with the lode on the foot wall side. The ankerite mass is more than 300 feet wide. Portions seem to be almost pure dolomite, the iron constituent being absent. Some of this rock contains mariposite in abundance and in other parts it is missing. The quartz at a certain point on the eminence known as South Pinon Blanco contains small crystals of tetrahedrite, and this rock is rich in gold. The oxydation of the gray copper has produced a large number of small blue specks of azurite. This characteristic has been noticed at several mines on the central gold belt, notably at the Alameda mine, the Rawhide mine and Rawhide No. 2 in Tuolumne county.

W. H. S.

Mining Summary.

ALABAMA.

State Geologist Eugene A. Smith has issued a statistical bulletin showing production of ores and metals in that State for the first quarter of 1899 as follows: Coal, 1,761,271 tons; coke, 358,320 tons; iron ore, 546,310 tons; pig iron, 242,590 tons. Partial returns are also given on the following substances: Stone for flux, 111,029 tons; bauxite, 2918 tons; lime, 31,500 barrels.

ALASKA.

Great activity in the Atlin Lake district is reported. Numerous new strikes are being made, some of them promising. Wilson creek has been located for five miles. It is situated over the summit which divides Dixie from Pine, Spruce and Boulder creeks and the claims on the north side. Prospectors think that Dixie and the creeks in that locality will yield abundance of gold. A new strike was recorded on Hitchcock creek. Pans have yielded coarse gold as large as BB shot. Another new creek not yet named is being staked. On Pine, Spruce, McGee, Birch, Boulder and El Dorado development work is being done with good results. On McGee creek and its tributary—El Dorado—pans running as high as $1.50 to $2 are being made.

ARIZONA.

A report is current that the Azurite copper mine had been sold to Eastern parties for $500,000. It is known that an option was secured some time ago on this property, and three parties are waiting their turns to secure consideration from the owners.

Globe *Silver Belt*: The Commonwealth M. Co. of Pearce is to add thirty stamps to its mill, having opened a large body of ore in the lower levels.

Prescott *Courier*: On the 12th of April, S. M. Waterman discovered and located the Humming Bird mine, Walnut Grove mining district. He has done 15 feet of work on the claim all in ore. The pay streak is 8 inches wide. He brought to Prescott 800 pounds of the ore which gives an assay of 5.38 ounces gold per ton. Adjoining the Humming Bird is the Olive, also owned by Mr. Waterman, which has 30 feet of development and a vein 4 feet wide, ore from which carries 14% to 19% copper and seven to eight ounces gold per ton.

CALIFORNIA.

Alpine.

Gardnerville *Record*: E. Lewis and F. Musser of Markleeville, while prospecting Boulder Hill, have discovered a ledge. They have three men at work driving a tunnel. The ledge is not large and it will take some time before the full value of the mine can be determined.——Boulder Hill is a mountain of boulders and in the early 60s, when the Alpine mines were first discovered, boulders rich in gold were discovered on this mountain, an arrastra built and worked, the gold-bearing boulders paying fair wages, but no ledge could be found.

Amador.

Amador *Dispatch*: At the Butte Mountain mine, east of Jackson, Supt. R. L. Marsh, a tunnel is being driven to a point where two lodes intersect, 200 feet below the surface. The tunnel is now in 300 feet, and an upraise is being made to the surface. The cost of mining and milling the ore will not exceed $1.50 a ton.——At the Zeila mine at Jackson drifts are being driven at the 1080 and 1300 levels. The mill is dropping fifteen stamps, as little ore is being hoisted while the drifts are being run.

Jackson *Republican*: At the Amador Queen, Supt. Dye reports the shaft down nearly 1200 feet and the crosscut showing a ledge of gold-bearing matter 310 thick.——At the Queen No. 2 ore has been struck and a quantity sorted. A tunnel 1200 feet long reaches the ledge. A shaft is being sunk from the tunnel, and in this shaft the rich ore was found. An unusual flow of water was struck on the 5th inst., since which time little has been done except to pump water.——At the Valparaiso five men are at work, searching pockets irregularly distributed through the slate and greenstone which separates the two ledges. The gangue is quartz, containing gold and auriferous arsenical pyrites. The lessees are handling ore that will go from $25 up, all low-grade ore being rejected.——The Peerless mine shows a ledge of decomposed quartz 4 to 7 feet, mixed with slate near the outcrop. The shaft is down 35 feet.——Prospect work is being done at the Moore mine, a mile south of Jackson. A crosscut is being made from the bottom of the old shaft 60 feet deep to find the east ledge.——A tunnel has been started on the Belluomini ranch, one-half mile from Jackson, to cut the ridge which runs from Jackson creek west of town, south toward the river.——The Doyle mine, near the Amador Queen mines, is being pumped out, and the shaft will be extended 500 feet to reach the ledge at the hanging wall.

Butte.

Oroville *Register*: Two dredges will be built by the Risdon Iron Works of San Francisco, to operate below Oroville.

Marysville *Democrat*: Workmen in the employ of the gas company struck gravel at the corner of C and Fourth streets, which was washed and found to contain gold in a quantity that would pay. This dirt was hauled from the gravel pit near the racetrack, and there is plenty of it remaining in the bottom of the pit.

Calaveras.

J. V. Coleman is making preparations for the starting up of the Angels mine.

The grading for additional twenty stamps at the Lightner mill is progressing. Much blasting has to be done.

The Utica mine and mill are idle waiting for the castings needed to repair the damage to the hoist.

The Bruner mine, near Angels, is reported sold to southern California men for $35,000. The shaft is to be sunk to 600 feet. W. Wall is Supt. It has been named the St. Lawrence.

Mokelumne Hill *Chronicle*: The Independence mine, owned by D. Conradi, is one-half mile east of Railroad and comprises 160 acres of ground, the main channel running its entire length. Mr. Conradi and partner are working on the north end of the claim, having a tunnel in over 100 feet. They have 5 feet of gravel that can be breasted out 125 feet. Their last cleanup of 230 wheelbarrow loads netted $70 over expenses.——S. Smith, M. De Vries and G. G. Gates have purchased the Garnier mine, near Big Bar bridge, on the Mokelumne river. The property has a 10-stamp mill, compressed air and electric plant. The new owners propose to add ten stamps. The ore body averages 8 to 10 feet. The mine will hereafter be known as the Baltimore.

Angels *Echo*: The Melones M. Co. at Robinson's Ferry is advertising for bids for hauling 690,000 feet of lumber from Jamestown, which will be used in the construction of a mill. Bids for hauling general freight, including 1,000,000 feet of lumber, from Milton to the Reserve shaft at Carson Hill, are also called for.——The Big Horn mine, three miles from Murphys, has been sold to Fresno men. The mine was owned and worked by Taylor Bros., but three months ago they gave a bond to the new owners, who have been working it. The quartz of this mine is dark, of bluish color and much of it rich in free gold. The formation is mica schist.

El Dorado.

Amador *Dispatch*: W. R. Pearson of Cleveland, Ohio, will resume work on his Flagstaff and Mt. Hope mines, north of Grizzly Flats. Twelve years ago a company, of which Mr. Pearson was a member, erected a ten-stamp mill on the Flagstaff, but operations were suspended. Mr. Pearson now has a controlling interest, and will put men to work.——Mr. Jackson of Placerville is unwatering the Darling mine, near Georgetown, for an English company. The shaft will be sunk 300 feet farther.——The Placerville Slate Co., with a capital of $100,000, has been organized. The directors are T. R. Jones, H. E. Moody and J. F. Moody of Sacramento, and K. L. S. Cummings and G. W. Cummings of Placerville. The principal quarry of this company is north of Placerville.——Hayward & Lane have completed the dam on their hydraulic claim at Indian Diggings, and as soon as it has been approved by the Debris Commissioners work will commence.

Placerville *Nugget*: The Blue Gouge mine at Sly Park has been sold to a Boston company, who will open it and put in improvements. E. Bind will be Supt. of the mine. A new tunnel and drifts will be run, and in the 300-foot tunnel will be run two upraises. A mill will be built and work will be commenced on a boarding house and offices.

Inyo.

(Special Correspondence).—The Harrison & Godsmark Co. now have their 10-stamp mill running, the only drawback being the tram, which up to date has not been able to keep the mill supplied with ore; but they expect to make improvements in the trolley wheels that will insure better work. They have from 12 to 18 feet of ore which is milling $10 to $12 per ton in free gold, while the tailings show assay values of $12 to $14. The ore chimney has been developed to a depth of 250 feet, and drifts have been extended over 200 feet, with no indication of giving out. The company owns 6000 feet on this ledge, which shows several other chimneys of ore beside the one now being worked. It is a large lead and gives indication of becoming a large gold producer.

The P. D. Q. Cyanide Co. have finished the tailings at Montgomery's mill in Pleasant canyon, from which they succeeded in extracting $8 per ton. This lot of tailings is the product of the World Beater and other mines of the Montgomery Bros., situated near the head of Pleasant canyon, and near the Harrison & Goldmark mine.

The Cyanide Co. will begin on the tailings at Anthony's mill with a ten-ton equipment, and will send a like plant to the Reward mill to handle tailings there. They have also ordered a small plant in sections, to be packed into Beveridge district.

Grading has been finished and preparations made for moving the Bryan mill, formerly at the mouth of Pleasant canyon, to the World Beater mine; when this is done another bullion producer will be added to the county.

Charles Anthony has 50 tons of ore at the mill ready for crushing.

Weaver and Porter Bros. are running their mill at Ballarat on custom ore.

Last week, at Stone Corral, one man pounded out $80 and another $130, in a hand mortar, in a few hours.

Ballarat has an air of permanence, as evinced by the number of women and children now seen there. A good lodging-house is the latest addition to the town.

The shipment of 16 tons of ore recently made by Barnes & Anderson, from their mine east of Independence, worked over $100 per ton. This ore was taken out of a hole 10 feet deep, by two men, in a few weeks. The mine was discovered two months since, and promises to be another Keynot in the production of high-grade gold ore.

Independence, May 24th, '99.

Kern.

Randsburg *Miner*: C. Koehn is having 100 tons of the dump at the Winnie mine milled at Barstow.——Preparations are being made to sink 1500 feet in the main shaft of the Trilby. An engine has been ordered from the Union Gas Engine Co. of San Francisco of 130 H. P., with auxiliary engine of 15 H. P. to be placed at the top of the double-compartment shaft. This engine will have power to raise 6000 pounds 300 feet per minute. The dividend declared for the month of April was $15,000.

Los Angeles.

A 400-barrel oil spouter is reported from Fullerton. The well reached oil on the 28th ult., at the depth of 1460 feet. It belongs to the Graham-Loftus Oil Co. The well is deeper than any other in the field. The Santa Fe people have a well 1200 feet deep, 100 feet from the gusher. The discovery of the new Graham-Loftus increases the daily production of the field to 700 barrels, and it is now as large a producer as any other section in the State. The oil ranges in gravity between 20° and 22°, although oil of 32° gravity has been found in three of the most easterly of the wells worked. The oil is now worth 80 cents to $1 a barrel.

Nevada.

Nevada City *Herald*: J. R. Ritchie has begun work on his new quartz claim, the Examiner, in Omega district.

Placer.

Colfax *Sentinel*: The J. D. Peters M. Co. of Green Valley have raised a shaft at the end of their bedrock tunnel, now in about 900 feet. The shaft is 70 feet to gravel. They expect to run 250 feet to the channel. The gravel found in shaft prospects good.——The Polar Star mine has been closed down for several days on account of repairs on the South Yuba ditch.——Development work is progressing at the Van Avery mine, in Blue Canyon mining district. The mine is the property of the Alder Creek M. Co. Twenty more men will be put on. A compressor plant has been ordered. Ten stamps will be added to the mill in July.——The Dutch Flat Blue Lead M. Co. has opened promising gravel in their tunnel, one-half mile below Dutch Flat. The tunnel is now in 854 feet from Dutch Flat ravine. Several upraises have been made, a channel of 200 feet has been prospected. In former years gravel was found on this lead from 350 to 400 feet in width. The body of gravel prospects for 3 feet above bedrock. It is cemented and a mill will be necessary. The principal owners are G. K. Rider, E. Breuner, J. Breuner and A. Breuner, D. W. Carmichael, G. S. Brand, M. J. Curtis and W. Lampert of Sacramento. S. C. Jordan of Dutch Flat is superintendent.——The Alameda quartz mine is located on the south side of Bunce canyon, on the Forest Hill road, 4½ miles southeast of Colfax, and is owned by F. Wise and M. Partridge. The gold-bearing vein is a porphyry dyke or ledge 100 feet in width, which runs north and south, and is cut by seams running diagonally across it. For a depth of from 25 to 40 feet the dyke formation is soft, and they have worked the claim by sluicing. Wm. Shaub and E. Jones are making wages sluicing tailings from this mine.——The extension north of the Alameda, the Annie Laurie, is owned by G. Nissen. The decomposed ledge is 100 feet in width and is sluiced to a depth of 35 feet. Mr. Nissen cleaned up $170 from a 16½ days' run. Three tunnels have been run 90, 78 and 68 feet.——A. Weske is running a tunnel from the American river to tap a ledge parallel with the Alameda. The tunnel is in 85 feet.

Auburn *Republican-Argus*: The Jupiter Con. M. Co., an Auburn organization, owning the Jupiter and Winchester mines, near Iowa Hill, has ordered machinery and is preparing to work the property. An incline has been run down the rim rock 225 feet, and a slope will be run from the foot of the shaft. F. H. Harvey, E. M., of Galt recently visited the mine in the interest of Sacramento stockholders and will act as consulting engineer. Following are the officers of the company: R. F. Rooney, Pres.; T. J. Nichols, Vice-Pres.; B. B. Deming, Sec'y; C. Wickman, Supt. The above are the directors, together with W. S. Graham. The mine is south of the Morning Star.——It is reported that the Mineral Hill mine, near Spenceville, has been sold to a New York company for $50,000. The mine carries gold and copper.

Nevada *Transcript*: O. Woehler of Spenceville, who has been to North Bloomfield to inspect a copper mine owned by the McKillican estate, will probably open it up. The mine is about a mile from North Bloomfield.

Auburn *Herald*: C. Hollen has six men at work on the Boulder mine and will sink the shaft deeper. He has leased the Malmberg quartz mill in Auburn ravine.——Washing at the Big Gun claim at Michigan Bluff uncovered fair gravel, but the water season was so short the owners were unable to realize much.——An electrician is making an estimate of the expense of putting in an electric plant at the Red Point mine.——There will be more prospecting this season than ever before at the eastern end of the Forest Hill divide.——W. Nicholls is hydraulicking at the Polar Star. The gravel pays.——The Gold Run M. & M. Co. is handling rich gravel, but has lost the grade.

Plumas.

Quincy *Bulletin*: Richards & Eva have resumed work on the Golden Gate west of Quincy.

San Bernardino.

The Gold Chief mine, six miles west of Manvel, owned by R. Young, has recently been investigated by Los Angeles people, and it is reported that they will undertake active development of the mine. It is a large, low-dipping ledge of gold-bearing quartzite.

It is reported that the Resting Springs lead-silver mines, which thirty years ago were operated under the direction of J. B. Osborne, are to be reopened. A smelter built at that time is said to be in good condition. There are some good gold prospects in the Resting Springs camp.

Stilson & Hall, at Vanderbilt, are working the Gold Bronze mine at the lower end of the village, shipping high-grade ore to Kingman.

Yuma *Sentinel*: Placers along the Colorado river are attracting attention and gold-bearing gravel beds have recently been located for 200 miles above Needles. Several companies have been organized and are preparing to operate. A large number of individual enterprises are taking out gold in paying quantities.

Shasta.

(Special Correspondence).—Lewisohn Bros. of New Jersey continue development work on the Galinsky group of copper properties near Kennet, and fifteen men are employed under the supervision of Wm. Kemp. Previous to the work begun by the present bonders of the property a crosscut tunnel had been run 128 feet at 100 feet depth, all in copper ore.

The Mammoth mine, formerly known as the Backbone, four miles from Kennet, under bond to J. F. Coleman of New York City, is doing development work under the supervision of H. Woolcock. The property comprises 1000 acres. There are 1000 feet of tunnels, the lowest being 100 feet below the apex. The greatest depth attainable is 1000 feet. The lowest assay of the ores was 4% copper and from that to 37%, and $1.96 gold and one ounce in silver. Eleven men are at work. There are many hundred tons of ore on the dumps. The main workings are in solid ore for 150x90x80 feet. The distance from railway is two miles. Wood and water is plentiful. A smelter will be built at Kennet.

The Uncle Sam mine has seventeen men at work while adding fifteen stamps, which will give a total of thirty stamps. When completed the force will be increased.

Near Shasta, the old Spanish mine, Supt. Shephard, is employing ten men at development work. The mill is temporarily idle.

Swasey & Howell, two miles from Shasta, are reopening the old Thompson mine and hauling ores to the smelter.

Garvin & Taylor are reopening an abandoned property near Shasta and forwarding ores to Keswick.

Development on the Colorado mine, which also produces smelting ore, shows 3½ feet of ore in a 50-foot shaft.

Ingram & Davis, near Shasta, made a shipment of ore to Keswick that yielded $50 a ton.

Almost every known available ledge in this part of the county has been located and prospecting work progresses as it never has before in the history of Shasta county.

Shasta, May 29th, '99.

Redding *Searchlight*: In the northwest corner of Shasta county, near the Trinity and Siskiyou line, and twelve miles northwest of Castella, has been opened a ledge of free gold ore. There are eight claims in the group, lying on a ridge of porphyritic diorite. The claims are the property of H. Nofsinger, A. Johnson and the estate of J. M. Bryan. The ledge runs northeasterly and is developed by two open cuts and a shaft 50 feet.

Shasta *Courier*: Work has been resumed on the Nigger Hill mine, midway between Shasta and Keswick and owned by Dunn Bros. The work is under the direction of W. Cheynoweth of Shasta. R. G. Dunn, Wells-Fargo's agent at Redding, is one of the owners and is investigating his mining interests. He is also one of the owners in ground at Copper City, in a claim adjoining the original Williams & Kellinger. The Nigger Hill claim is on an eminence in the Rock Creek district, adjoining Shasta.

Sierra.

Downieville *Messenger*: Preparations are being made to transport a wire rope to the Lewis ledge on the Middle Fork. It is 6000 feet in length and will be carried five miles on mules over a narrow trail. It will be cut into six pieces of 1000 feet each. Each of these pieces will require five mules to carry it. The rope will be used for the tramway that will connect the mine with the mill.

Siskiyou.

The miners of Sugar Creek district are busy. The ores in this district are chiefly copper containing values in gold and silver. Some of the ores contain native copper.

Yreka *News*: J. M. Quigley has discovered a vein of mica on Marble mountain.——It is reported that C. A. Mitchell has discovered a ledge cropping, 2000 feet in length with an average width of 50 feet, of tin ore on Klamath river.——A nugget of gold and quartz, weighing ten and a half ounces, was found recently by a Portuguese miner named Fernandez. The gold was found 800 fine. Fernandez refused $150 for the nugget.

Yreka *Journal*: Hadley & Tucker have been finding pockets of gold quartz on Scott river.——Several quartz claims have been located on Patterson creek in Scott valley, in the neighborhood of the Sheba mine and around the Goodale place at lower end of Scott valley, also on Shackelford creek.——H. Harris the Humbug miner, has rich quartz from the Mocking Bird mine at Humbug. The ledge is 3 feet wide.——The miners at the Golden Star at Humbug are working on the upraise to the old works from the tunnel and will drain the upper levels besides stoping.——The Yreka M. Co., working the Greenhorn blue gravel mine, is reported to be taking out pay ore and has a good supply of water.——Austin & Co., working the deep bedrock diggings on the flats, north of the Yreka High School, continue to find good prospects.

Grant's Pass *Courier*: Three hundred tons of copper ore is being packed on mules from the Siskiyou copper mines on lower Illinois river to Selma, fifteen miles, from which it will be hauled in wagons twenty miles to Grant's Pass and shipped by rail to San Francisco.

Yreka *Journal*: The Golden Eagle ledge has been found at Indian Creek in the tunnel lately extended near the old works and averages $80 a ton. The ledge is 18 to 30 inches in width. A new mill is to be put up.——F. D. Fraser will commence operations on the Rostel and Nehrbass ground, adjoining the blue gravel mine at Greenhorn.——The Yreka M. Co., working the Greenhorn blue gravel claim, continues to take out pay, keeping a large force employed day and night. The pay channel extends towards Yreka creek.

Tulare.

Porterville *Enterprise*: The third payment on the Minnie Ellen mine at Deer Creek has been made. Reports are that the prospects are good. The investors have sunk a shaft 51 feet, drifted 27 feet west, 20 feet north and

south. The rock will average $15 per ton. The ledge is 7 feet wide. The shaft will be sunk 50 feet farther and drifts and crosscuts run. Water will be piped from Deer creek and a stamp mill erected. There are 250 tons of ore on the dump.——H. Etter and W. Hastings are reported to have discovered a gold vein on the Hamilton ranch, north of White river. It seems to be a continuation of the Minnie Ellen mine at Deer creek, about six miles south.

Tuolumne.

The ore in the central ore chute at the fifth level of the Santa Ysabel mine, near Quartz mountain, is showing as well as that in the fourth level. The shaft is down 650 feet, and sinking will be pushed to the sixth and seventh levels. A partial mill run showed satisfactory results.

Sonora *Union-Democrat*: In the Dreisam, at Arrastraville, connection will be made by a raise from the 230 level and sinking from above. When the connection is made it will change the shaft to one of two compartments. The crosscut tunnel is in 415 feet, and 35 feet more will reach the east vein.——At the Buchanan everything is reported in good shape. The main shaft is down 600 feet, with sinking in progress. Since Mr. Moorehead became Supt. this shaft has been sunk 260 feet.——The report of H. M. Pease, Supt. Mazeppa mine, for the year ending April 30th, is as follows: Work on the Mazeppa was commenced on May 20th, '98; sinking was commenced on the east vein, but was abandoned at a depth of 40 feet, surface prospecting showing that the west vein was richer; a shaft was started at an incline of 70° on the latter ledge and sunk 70 feet by hand; at this depth a 40 H. P. hoist was put in and sinking resumed; on April 30th the main shaft had reached a depth of 268 feet, with sinking going on; at 100 feet the first crosscutting was done, the vein measuring 18 feet and exposing a body of ore; the south drift was driven 70 feet on the vein; the north drift is in 12 feet, the vein 11 feet wide, showing free gold; but as the ore body is richer south, operation is being confined in that direction; the east crosscut from the 100 is in 45 feet, and the middle vein will be reached in 25 feet; the ore in the Mazeppa ranges in grade from fair to very rich, and it is estimated that there are 800 tons on the dump; a 20-stamp mill will be put up and dropping by Nov. 1st.

Jamestown *Magnet*: Supt. A. Dron of the Longfellow mine, Big Oak Flat, states that the Longfellow G. M. Co. has purchased the Nonpareil mine on Deer Flat. He has stopped sinking the incline at the Longfellow mine, down 350 feet, and is drifting at the 300 level. The Longfellow mill is running steadily on ore from the old dump. Twenty-four men are employed.——The Jumper mill is dropping sixty stamps—fifty on Jumper ore, ten on ore from the Golden Rule mine, which is now connected with the Jumper mill by tramway. Two new rock breakers have been set up. These and the air compressors are operated by electric power. A new blacksmith shop, 30x40, is being built.——The mill on the Hilton & McPherson mine, at Sawmill Flat, has commenced crushing ore.——At the Hope mine the tunnel has been extended 180 feet. Stoping will soon begin.——Late developments at the Vine Springs mine are encouraging. In the lower level there is a shoot of sulphuret ore.

COLORADO.

BOULDER COUNTY.

The Magnolia mill will start up this week. It adopts the bromo-chlorine process.

Denver *Republican*: Shipments continue from the Gillard mine, one of the properties of the Gold Extraction, Mining & Supply Co. Carload lots have yielded $20 to over $30 per ton, and a higher grade $90 to $180. This property and several claims adjoining have been examined by English capitalists, and as a result a company called the Nancy Gold Mining & Milling Co. has been incorporated with a capital stock of $200,000, to which company the Gold Extraction, Mining & Supply Co. has sold the Gillard, Wedge, Grand View, Freya and Doss No. 2 lodes, and the Hastings tunnel and tunnel site, the latter company holding a controlling interest in the new. The capital invested will be used in opening the properties and increasing the output. The Hastings tunnel will crosscut the lodes at a depth of 500 feet, and a power plant will be put up at the mouth of the tunnel. A hoisting plant will be installed at the Gillard shaft, which will be sunk to the Hastings tunnel. Prospecting will be done on the Freya, Wedge and Grand View. The Freya has a shaft 120 feet deep and the Grand View one of 80 feet.——At Summerville, in this district, a mile and a half from Wall Street, work is being done on the Victoria, which has recently been acquired by the same interests which own the Lucky Star and Trident. Improvements are under way. As soon as they are completed twenty-five men will be employed in sinking shaft No. 2 from its present depth of 450 feet and drifting east 125 feet to intersect shaft No. 3, and west to shaft No. 1, 475 feet distant. This property has a record of production of $500,000.——Considerable other work is being done near Summerville, notably on the Goldsmith Maid, Scotia, Cash and Sterling.

CLEAR CREEK COUNTY.

The Mendota mine at Georgetown will be worked for its zinc ores, which are to be shipped to the smelter at Upland, Ind.——E. W. Humphrey, representing the Upland smelter, has secured a lease of Mr. Maxwell on the Mendota, and has also leased the Bush tunnel and lodes cut by the Burleigh tunnel, all of which carry bodies of zinc ore. A number of men are at work and more will be added until the output of the Mendota amounts to one car per day.

Georgetown *Courier*: Rodda & Bradley have made a discovery on Republican mountain, from which they are taking ore that carries 365 ounces silver, 2 ounces gold and 15% lead.——McLaughlin & Co. are drifting on a body of ore in the Polar Star Extension east. Their last run returned 369 ounces per ton.——Bellotti & Co. have a body of high grade ore in their lease on the Aliunde.——Rogers Bros., working the Paymaster, have a body of lead ore and will commence shipping.——C. Carleson on the Mendham, East Argentine, has 200-ounce ore.——Six assays of ore from the Ona Bell averaged 3 ounces gold and 200 ounces silver.——The shop at the Josephine mine, carried away by a snowslide, has been rebuilt. C. Butterfield has charge.——Nyquist & Co. have a crosscut to the north wall of the Independence, in East Argentine, and found a 2-foot vein of mineral, some of which is rich.——Johnson & Segstrom have scattered mineral that mills 150 ounces silver and ⅓ ounce gold.——Roberts & Sherman have a discovery on Leavenworth mountain from which they have taken rich gold ore.

Silver Plume *Standard*: The Comet and Gambetta mines near Georgetown have been leased and will be operated, an option having been secured on the latter. While zinc is the metal sought for, operations will not be confined to that alone, but where ore is found which shows greater value in other metals than zinc, it will be sold in the markets, and it is likely a mill for concentration will be erected.

GUNNISON COUNTY.

The strike reported in the Venable mine at Spencer, near Vulcan, is causing excitement. The ore is said to make smelter returns of $4000 per ton in gold. There was an excitement in that region five years ago, but it died out. Some good strikes were made in the Goose Creek and Domingo districts.

At Pitkin, on the opening of the South Park road, a shipment of five carloads of ore from the Maid of Athens mine will be made, and that will be followed by daily shipments. The Maid of Athens is the lost mine of Mineral Farm basin, discovered eighteen months ago. The vein is 24 feet wide. The ore is chiefly quartz, impregnated with native silver. It averages $25 per ton. The quartz is fissured, and the seams are filled with galena, which carries 600 to 1300 ounces of silver and some gold. The Maid of Athens is owned by W. Friend, T. Huxtable and others, the two first named being the discoverers.

LAKE COUNTY.

(Special Correspondence).—The properties of the Morning Star Con. and Evening Star M. Co., on Carbonate hill, are keeping up their record of 100 tons of ore per day, from which they have not varied materially for several years. The entire property is worked by lessees, whose general operations are under the directions of the owners. By this arrangement there was no cessation of work during the labor strike of two years ago. Originally these workings were in two contacts of lead carbonate ore that were worked from the outcrop; but the present deeper workings are in bodies of manganiferous ores, the latter occurring under the carbonate deposits. Present ore shipments average in value about $3 per ton. The Evening Star group has four working shafts, and there are twelve on the Morning, all ranging in depth from 100 to 700 feet.

A local company known as the Maid of Erin and Henrietta Silver Mines Lease, are operating as lessees on that part of the Maid of Erin above the 700-level. They are hoisting from the 450, 500 and 615 levels, and shipping therefrom 50 tons per day ores running in lead carbonates, sulphides of iron and copper. The old workings of the Maid of Erin extend to the 900-level, but all below the 700 is under water and leased to S. Nicholson, who has also a lease on the Wolfe Tone and adjoining property, which is likewise in water from the 650 to the 1000-foot level. The lower workings of the Maid of Erin and those of the Wolfe Tone are connected, and it is said to be Mr. Nicholson's plan to unwater the two properties and work their lower levels. The Wolfe Tone upper levels are and have been producing. Mr. Nicholson has also a lease on the Adams, below the 600-level.

The Mahala, on the same zone as the Maid of Erin and Wolfe Tone, is producing rather lightly now, but expects soon to be shipping 150 tons per day. The ores of this property contain little carbonate, but are chiefly iron and copper sulphide, with values in silver, gold, lead and iron. The Mahala main shaft is 1130 feet deep and requires constant pumping. Originally this mine worked in lead carbonate ores. WASCOTT.

Leadville, Colo., May 21st, '99.

Leadville *News-Reporter*: O. C. Bartholomew, owner and manager of the Sadalia mine, has been making investigations of the progress of the several mines in Big Evans gulch, and says of all the shafts in that section there is not one failure.

MINERAL COUNTY.

The unwatering of seven of the largest silver mines of Creede commenced when a diamond drill operated in the Nelson tunnel tapped the bottom of the Last Chance shaft. The mines drained include the Last Chance, Commodore and New York. The lower workings of these mines were abandoned on account of water, which was hundreds of feet deep in all of them.

This is the first of the important unwatering propositions contemplated by the Nelson tunnel. When completed the tunnel will be three miles in length.

Among the mines on the line of the Nelson tunnel are the Bachelor, Commodore, Last Chance, Amethyst, Happy Thought and Park Regent. The New York adjoins, and will be drained through the Last Chance, as they are connected by drifts in three places.

The Nelson tunnel is now in more than a mile and a half.

The next mine that will be tapped is the Amethyst, which has more water, more drifts and stopes than the Last Chance; 1000 feet more will have to be tunneled before this property is reached.

The Amethyst, Last Chance and nearly all the mines on the line of this tunnel have been working under leases for three years, but only the upper levels have been worked, owing to the inability of the pumps to clear the water from the lower workings.

OURAY COUNTY.

Telluride *Examiner*: The Skyrocket mill, below Ouray, has been started up by Price & Philbrin. They buy ore and take chances on the returns.——It is reported the Yankee Boy mine and mill are to be started up. They are in the Sneffles district. In former days the mine produced rich silver ore, but now runs more in gold and lead.——Improvements go on at the Camp Bird mines and mill. Extensive development is being done and shipments are regular. Capacity of the mill is being doubled by the addition of twenty stamps and other machinery. A cyanide plant is proposed for the tailings that are impounded below the mill, and an electric system is in contemplation for power and light.——A strike is reported adjoining the Slide mine, owned by T. W. Emerson of Ouray.

RIO GRANDE COUNTY.

At the Con. M. Co., at Summitville, steady production will be commenced, the new roasting furnaces having been completed. When the consolidation of interests in the properties was effected by G. Crawford a year and a half ago, the mines had not been worked for ten years, the tunnels and many of the drifts were filled with ice, which had to be blasted out, the timbers were broken and rotted, and in the drifts caves had occurred. The clearing out of ice and debris, and repairs, made work for months. When the ore bodies were reached it was found that there were quantities of low-grade ore carrying values to guarantee operation, but a test in the company's mill showed them to be refractory. After a series of experiments it was decided to install roasting furnaces. The work in the mine has opened up bodies of ore and proved the property to be of value. The announcement is made that the furnaces will be fired this week. The alterations necessary in the mill have been completed.

SAN MIGUEL COUNTY.

Telluride *Examiner*: The new forty stamps of the Liberty Bell mill are nearly completed. The stamps now operating are turning out a good product on the plates and in concentrates.——The Butterfield mill of ten stamps in Bridal Veil basin will soon be in operation on Waterloo ore. At the Waterloo a large quantity of ore is awaiting treatment. Tests by the processes at a number of mills will be made before the building of a mill is begun.——The Smuggler-Union mill at Pandora is undergoing repairs. Work on the new mill, which is to have a 200-ton daily capacity, is well under way.——The force at the Silver Pick is being increased. The concentrates from this mill constitute 20% of the ore, and the season's shipments promise to exceed those for years past.——The Tomboy mill is beginning the season with smaller forces at the mine than in the past, from the fact that the veins in new ground are yielding a larger and richer product than formerly.——The Gold King, with three shifts, is turning out a good product. The values are largely saved on the plates, the ore being free-milling. Thirty-five men are employed by Mgr. McCoy at mine and mill.——The Jim Corbett and Lizzie G. keep up regular shipment from Saw Pit. The former property is looking well. The Lizzie G. has already paid its owners good returns.——There will be a resumption of work at the Bessie mine and mill, with some new appliances added to the mill.——The Butterfly mill is treating ore from the mine; seventy-five men being employed.——It is said work will be done on the Merry group discovered last season, near Ophir. The find was made by Crawford & Hyatt, and ore taken from the surface returned seven or eight ounces in gold.——F. P. Morgenson has started work on the Butler.——Operations are active in the Marie Antoinette group. The Suffolk mill is treating the ore. Returns vary between $8 and $40.——At the Gertrude mine, Mr. Brink, one of the owners, will commence on a mill of thirty stamps, the building to be erected for the accommodation of a larger number. Experimental tests have been made on ore from the Gertrude and it will yield $6 to the ton. The body of ore is 100 feet wide. A large tonnage was milled at the Illium plant a year ago.——San Bernardo mines are active and will soon be turning out their usual spring output of high-grade ore.——The Suffolk Co. is working its ground with small forces, which will be increased. The mill is dropping twenty stamps.——The weekly shipments from Ophir amount to several cars, and the tonnage increases as the season advances. The Carribeau and Silver Bell are the heaviest shippers.——D. Martin, owner of the Silver Tip group of five claims—Silver Tip, Bob Lee, Free Coinage, Independence and Lone Star—has made a strike on the Silver Tip. There are three veins, two intersecting each other and one crossing the other two below the intersection. This is the vein in which rich ore has been discovered. The pay streak is 10 to 12 inches.

IDAHO.

A strike is reported in the Monte Cristo claim, in the Buffalo Hump camp, a mile and a half south of the Big Buffalo. The claim is operated under $60,000 bond by S. I. Silverman, J. F. Cameron, W. S. Norman, G. Potter and L. C. Gilliam of Spokane. At a depth of 15 feet an assay of the bottom goes $74 in gold. The claim is owned by J. Turner.

Men are arriving daily at Buffalo. Assessment work is being done and work begun upon various properties. Trails and other improvements are being made. The snow is 10 feet deep.——The Monte Cristo has commenced work with six men. They have been hauling supplies to the mine on toboggans. W. H. Hill, Supt. of the Big Buffalo Co., commenced work last Monday with four men on a pack trail into the camp from Badger. The trail will make an improvement over the old road, saving five miles.——F. Brown is building a trail from Camas prairie. It is expected to reduce the distance to the prairie to forty-five miles.——Residents of Buffalo who get their mail by way of Elk City pay $1 per month apiece for the service—no large packages allowed.

The Last Chance mine near Wardner has started up with a small force of non-union men.

Spokane *Spokesman-Review*: W. Carter, formerly Mgr. of the Blue Jacket mine in the Seven Devils district, says the entire ledge contains pay ore. There is a 4-foot streak that is rich. Two carloads of ore from that streak were shipped to the Nickel Smelting Works in New York, returns showing 54% copper, $18 a ton in gold and $12 silver.——There is excitement in Boise basin over the discovery of a gold ledge three miles west of Idaho City, in a section famous for placer gold. E. Burson made the discovery while placer mining. The ledge is 6 feet wide, all ore, while on the hanging wall is a streak 8 inches thick that is rich.

Wardner *News*: Copper strikes are being made on the lower Illinois river and in the vicinity of Preston Peak. Several copper miners have been in that locality for some time making examinations.

MICHIGAN.

American Manufacturer: The Stevens property, on the Mesaba range, upon which 40,000,000 tons of ore are said to be in sight, was bought by the Oliver M. Co. recently. It gets a lease for ninety-nine years at 15 cents royalty. The ore is said to be largely non-Bessemer. The Oliver Co. will mine 400,000 tons of ore at the Queen group this season. It is announced that this company contemplate buying the Champion mine at Champion.

MONTANA.

Montana intends to increase its copper output from 60,000,000 to 100,000,000 pounds annually. Improvements at the smelters will increase the capacity of each department 50% and that of the district 25%, and more men will be employed in the mines.

The Diamond R. Co., at Neihart, has commenced work on a large mill and concentrator to be owned and operated by the company, but equipped to do custom work. The building will be 250 feet by about 400, lying on the lode claims, the Frisco, Equator and '98. The floor space in the building will be 200x135 feet and the actual elevation 100 feet. It will stand on a steep hillside. The machinery will require 600 H. P., which will be generated from water by means of Pelton wheels. The lowest floor in the building will be traversed by a railroad spur. The gravity system will work throughout, and ore will be sent from mine to mill without hoisting or shoveling.

Wardner *News*: A strike is reported on the 50-foot level of the Bamboo Chief, one mile west of Virginia City. Assays from a vein 15 to 20 inches returned $1500 per ton. The lessees will lease the Largey mill, a short distance from the mine.——T. Cooney of Helena has discovered what may become a new quartz mining district within view of Helena, in the foothills near the Missouri river, on the road to Canyon Ferry. A lead, carrying free milling gold ore, has been opened by Mr. Cooney and partner during the winter.

NEVADA.

The official telegram of the pumping work at the C. & C. shaft, received in San Francisco, June 1st, reads as follows:

To Aug. Waterman, Sec. Comstock Pumping Association, San Francisco: The second elevator is working on half time, keeping the water down. The break in the discharge pipe of the first elevator was in the tapered steel section. It will be replaced with a bronze taper piece and regular discharge column that we have here. Will start lowering the first elevator again to-day, and expect to have that elevator running again in a few days.

G. McM. Ross.

The owners of the Grand Prize mine at Tuscarora are considering the building of a chlorination plant.

The Zadig drift, it is reported, will be run to connect the mines of the Occidental Co. with those of the Chollar & Potosi Co. at Virginia City.

Prospecting is going on in the mountains back of Genoa. Several of the claims are old ones, on which assessment work has been done for years. The German mine is the oldest of these, and was prospected by parties who have since abandoned it, after shipping a ton of ore to Dayton for a milling test, which, after paying $30 freight, returned ample to pay expenses.

Winnemucca *Silver State*: An important strike in copper was made in the copper mine at Brunswick owned by J. Yerington, B. Logan and D. Hickey last Tuesday. An east drift had been run from the main incline 120 feet below the surface, and the ledge tapped where it is 6 feet wide, and carries 30% copper.

Kingman *Miner*: The cyanide plant at El Dorado canyon is proving a success. Values are being saved up to a high percentage. The loss of cyanide is reported to be small. Thirty-eight tons of ore are worked daily, and the average value is $30. When all the refuse ore and tailings are worked up a plant will be put in and water pumped to the mine.

Reno *Journal*: The Comstock Pump Co. has secured the water right for three miles of the Truckee river above Floriston. It is designed to be used to generate electric power to be used on the Comstock and in Washoe and Ormsby counties——F. J. Button has returned to Virginia City from a ten-days' prospecting trip east of Golconda, where he found ore the same as that of the Adalaide and located ten claims in that section.

NEW MEXICO.

The pump for the reservoir well at the Texas mill has been put in place. The underground reservoir of drifts and crosscuts will

soon be completed. From this reservoir the water will be pumped to a reservoir on the surface from which the mill will be supplied. Good ore is being produced from the 300 level of the Grand Central and the 400 and 500 levels of the Texas. The mill is running day shift and making a high-grade concentrate. H. Niles, the Supt., has systemized mining and milling facilities.

It is reported that reliable parties have taken the St. Helena mine, owned by H. H. Whitehill and H. Woods. The mine has good bodies of gold ore which run an ounce of gold to the ton.

There is a probability that the big mines of Paschal will resume operations. P. R. Smith is at the mines in company with G. A. Schroeder. There are bodies of ore which run from 5% to 15% in copper.

There is excitement at Cooks over the discovery of bodies of zinc ore at Indian Springs. J. Mitchell, Supt. of the Kansas City Smelting and Refining Co.'s mines, is one of the owners of the new strike. He sent out a prospector who discovered the ore.

Forty men are employed in the mines of Chloride Flat, located almost within the limits of Silver City. All employed are working upon the tribute or lease system, paying the owners a royalty on ore sold. The leasers are making above wages, some of them clearing $25 to $50 per day.

Byrne & Co. are working a vein of lead ore half way between Silver City and Pinos Altos. The vein is a large one with streaks of lead ore which carry value in silver and gold.

B. C. Gillett has a lease and bond on the Copper Rose and Native Copper claims owned by J. A. Lucas and J. Clark. A cash payment has been made on the purchase.

OREGON.

The gold districts around Baker City are attracting attention. The Bonanza mine was recently sold for $1,000,000, and the report now is that the Red Boy mine is about to change hands for $1,000,000. The Red Boy is a paying mine. No one knows how much, as it is in private hands. The Red Boy has a 20-stamp mill and employs fifty men.

On the Burnt river, in Weatherby district, are good mines, among which is the Bonanza, or Shelton. This mine has passed into the hands of a Spokane company, which will operate it. The mine has produced $45,000 with a 5 stamp mill, and cleanups of from $1000 to $2500 monthly are made. In the vicinity are the Rattler, Gold Cliff, Gold Hill, Gallaher and others, making favorable showings. The Gold Cliff shows free gold in the ore, and samples have been shown running as high as $5000 per ton. A 2-stamp mill is on the claim, pounding out a few hundred dollars every month. Formerly Burnt river camp was quite prominent, but it has been neglected of late until recently. The report is that the new owners of the Bonanza mine will increase the mill from twenty to forty stamps. The mine is said to be in condition to supply 100 stamps.

The Golconda mill, employing Greenawalt & Robinson's electro-chemical process, is in operation.

SOUTH DAKOTA.

The Carr mine on Lightning creek, nine miles southwest of Custer, is reported sold to a New York syndicate for $105,000 by J. Sidney. Seven thousand dollars cash was paid.

The copper prospects on upper Box Elder, eight miles northeast of Rochford, are being investigated. The copper belt is broad and contains large zones of slate carrying carbonates and oxides of copper. Rich specimens and streaks occur, but the general tenor of the ore is low grade. These mines were discovered and prospected nearly twenty years ago. Copper also occurs in conglomerate on Box Elder creek.

Deadwood *Mining Review*: The last shipment of bullion by the Homestake Co. contained nine bricks, each weighing 130 pounds. The total clean-up was $350,000.——The Uncle Sam mine, on Elk creek, which has been idle for years, is nearly cleared of water and work will commence on the main shaft, down 100 feet. At that depth an incline has been sunk. The shaft will be sunk deeper and a drift run to the incline.——Work has been resumed at the Spokane mine, northeast of Custer, owned by the Crown Hill M. Co., S. E. Young Supt. The shaft is down 165 feet and it will be sunk to the 200-foot level.——The Creede group of five claims, owned by J. Demereau, C. W. Robbins and E. N. Davis, is nine miles southwest of Custer. Assays of the ore give 16% lead and $34 in gold. The veins in the district are in a flat formation.——The Cleopatra M. Co. owns a group of claims in Squaw creek comprising 100 acres. Tunnels have been run and a shaft sunk 75 feet below the creek, which opened ore bodies of importance. Water has been encountered which will require a pump. The company will purchase a hoisting plant. The Gen. Mgr. is R. B. Hughes, formerly of Rapid City.

UTAH.

C. E. Watkins, C. Sherwin and A. J. Strouse, who have been devoting time to the placer bars along the Colorado river, are preparing to ship to their camp special machinery, now being built for them. Dr. Watkins and his associates are the owners of 600 acres of placer ground between Dandy Crossing and Lee's ferry. The locations cover what is known as the "high ground" and adjoin those of the Hoskinini Gold Placer Co. of Salt Lake. The gravel, according to samples, shows from 50 cents to $3 per cubic yard. Mr. Strouse has been working the sands of the Colorado river for five years.

In the North country mining operations are active and everything from the Keystone is under development. Among these are the Raymond, Black Warrior, Ridge & Valley, Illinois, the Trixy group and the Jefferson. The Watts property is in the preparatory stage. The Jefferson M. Co.'s shaft has been retimbered and all is in shape for opening their property. P. T. Cook is Mgr.

Eureka *Republican*: Twenty men are employed on the Copper Mountain mine. This property is eighty miles south of St. George and thirty miles east of the Grand Gulch. Shipments will be made.——The Eclipse, adjoining the Sunbeam at Silver City, is being opened under contract, subject to the directions of D. C. Dunda, J. E. Jennings and J. E. Caine. The ore is carbonate and all the conditions are the same as in the Sunbeam.——J. C. E. King, C. W. Watson of Salt Lake City and J. F. Graham of Denver visited St. George to look over the Dixie property.

St. George *News*: T. Jennings of Salt Lake City has gone to the Grand Gulch copper mines. A. McDonald and party left recently to clean out the mine. This property was located by S. L. Adams and others thirty years ago and was worked till fifteen years ago, when work was suspended. The hauling in those days was to Milford, 200 miles.

Salt Lake *Tribune*: O. Nay tells of an important copper belt he has visited. This belt is in the southeast corner of the State and on the head of the west branch of Beaver Dam creek. Wooley, Lund, Judd, Dodge and others have mined there for years, but the copper belt has only lately attracted attention. He with several others prospected this copper belt and found a large quantity of high-grade ore that carries gold and silver.

Salt Lake *Tribune*: The Silver Shield M. Co., purchaser of the Silver Shield and Toledo mining claims at Bingham, has made its initial payment, $6000 being placed to the credit of the Tiernan estate, from which it has been purchased at a cost of $60,000. The mine is sending out enough ore to meet the requirements of its payroll.——The report is that Eastern parties have an option on the stock of the Ben Butler M. Co. of Bingham. Supt. M. McGrath reports it in most favorable condition. Work is progressing and a good quality of ore has been exposed. The properties are on the divide between Markham Gulch and Carr Fork.——Snake creek is receiving the attention of representatives of the Standard Oil Co.—— Supt. C. Rooklidge of the Queen of Sheba mine in the Deep Creek country, will make arrangements for the rebuilding of the mill that was burned in February.——Work on the Steamboat group of claims in Snake Creek district has commenced under the direction of C. Buchler. Four men were put on. A power plant is contemplated for this property, and can be cheaply put in, as the creek runs by the mouth of the tunnel; 300 feet of flume will give ample fall for power sufficient to run half a dozen drills. Work will be directed on the lower tunnel, which will cut the vein at a depth of many hundred feet.——It is reported an increase of the force will be made at the Daly-West.

Bingham *Bulletin*: J. H. Miller of Arizona is in charge of operations on Capt. DeLamar's Bingham property. For the present all work will be for development. Six tunnel contracts have been let and a large force is at work to prove the width of mineral-bearing rock. No sinking will be done at this time.——At Bingham placer several hours are devoted each day to washing gravel. Three shifts are employed in drifting, and a large area of ground will soon be ready for stopers.

WASHINGTON.

Palmer Mountain *Prospector*: J. E. Longacre will begin work on the Annie May, a Mt. Ellmeham property. A shaft will be sunk through the iron cap.——A road two miles long is being constructed on Gold hill. As soon as completed, work will be begun on a half-dozen claims which have been practically inaccessible.—— The Grand View, on Mt. Chapacca, has over 300 feet of open cuts, 150 feet in tunnels and 100 feet of shafts on ledges 10 to 40 feet, and assay values in gold. Mr. Redpath is continuing the tunnel, which will cut several veins.——J. Woodward is getting in shape for summer work on the Oro Fino, on Douglas mountain. This property is near the Little falls and rich ore has been taken from it.

Spokesman-Review: It is reported that the Liberty claim is to be prospected, either by shaft and crosscut or by the North Star tunnel into the Liberty.——Porphyry in the face of the Reindeer tunnel has changed, stringers of spar coming in.——There is 4 feet of quartz in the face of the Princess Maud drift. Assays vary from day to day.——Supt. Rice of El Caliph states there are 3 feet of quartz in the face of the drift. It is not as rich as some previously taken from the shaft.

Spokesman-Review: G. T. Eaves has gone to the south half, where he has claims on Bridger creek. The Papoose ledge is 20 feet wide. There is said to be 7 feet of ore that will assay $100 per ton. There is a shaft on the property 20 feet deep. The ledge lies between slate and porphyry. It was one of the first locations in the camp.——The Roaring Eagle is another prospect in that section. It is on the same ledge as the Papoose. It is 5 feet wide.——It is understood that the Big Six will resume work. —— The Insurgent ledge is 10 feet wide.——Supt. Lane of the Princess Maud says the ledge is 5 feet wide.——The shaft on the Bodie is 120 feet deep.——Supt. Ryan of the Republic Giant is sinking a winze from the tunnel.——There are no new developements on the Surprise. The ledge is 7 feet wide.

FOREIGN.

AUSTRALIA.

Melbourne *Standard*: Mr. Petherick, Mgr. Homeward Bound, at Yalwal, claims that at that mine the total cost of raising, crushing and cyaniding is not more than 7s 10d per ton, the cyaniding averaging 3s 6d per ton. Mr. Copeland recommends that the Homeward Bound Co. and the Pioneer Co. combine and put down a shaft on the creek below the mines, 50 feet, and ask the Government for assistance.——An attempt is to be made to test the deep lead under the basalt, near Tumberumba, and the prospecting board is sending an official to inspect operations.——Three parties of miners have left Sydney for the goldfields of the Braidwood district. Letters from individual miners state that payable wash is being found.——A large number of men have left Cobar for the White Cliffs opal field.——The M'Queen Bucket Dredging Co. at a trial run found the buckets brought up dirt without the amount of water necessary to treat the material. This necessitated stoppage to fix a pump to supply water. Mr. M'Queen has expended £1000 on his plant, and will be satisfied if the returns average 4d per ton.

BRITISH COLUMBIA.

The ore shipments from Rossland for the week ending May 27th were: Le Roi 1824, War Eagle 463, Iron Mask 37, Center Star 130. The shipments for the year up to date were: Le Roi 31,859, War Eagle 14,757, Iron Mask 941, Evening Star 36, Deer Park 18, Center Star 148. The ore shipments, owing to the accident in the War Eagle, have fallen off, but there is indication that during the coming week there will be an increase.

The Madison group near Nelson has been bought by the Montreal-London Gold & Silver Development Co. of Montreal for $20,000 cash. The group is owned by J. C. Eaton and San Francisco associates. Development was under the supervision of W. W. Warner. Up to the time of sale Mr. Warner had a lease on the mine.

The first shipment of concentrates from the Ymir mine was made the 27th ult., when forty-three tons were sent to the Nelson smelter. There is a large quantity of sacked concentrates remaining and twelve tons are coming down daily. An ore bin has been constructed by the Ymir Co. at the railway for ore which is to be shipped.

Ore shipments for the past week from Sandon were: Payne 250, Last Chance 60, Slocan Star 20, Whitewater 64, Madison 15; total 409 tons.

LOWER CALIFORNIA.

San Diego *Union*: A mill has arrived at Ensenada for the Real del Castillo gold mines, thirty miles east of Ensenada. The mill is for D. Goldbaum, and is for custom work. It will be operated by water power, and will crush ore from the Pueblo, Castillo and Guija mines, owned by Mr. Goldbaum.——A mill has arrived at Ensenada for A. Miller, and will be put up at the Alamo to crush rock from Mr. Miller's mine. —— The Viznaga mine near Alamo is reported to be in good ore and averaging $8000 to $10,000 a month in its output.——H. M. Russell has been at Alamo. The mill recently bought by him will start up.——A new mill will be put up at La Huerta, not far from Agua Dulce. San Diego parties are interested here.——The Escondido mines, on the road to Alamo, between San Antonio and Santa Clara ranch, are being developed and a new camp started. —— The Socorro placers, owned by H. Johnson, are running with more water than formerly.——There are fifty men employed at Buena Vista on the ditch, and by October the placers will be turning out gold.

SOUTH AFRICA.

The March yield of the Rand was 464,000 ounces gold.——During March the Crœsus mill at Johannesburg treated 6000 tons of mill tailings, producing 841.6 ounces of melted gold, at a cost of 1s 11.2d per ton.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

LINOTYPE MOLD ADJUSTERS.—John D. Harvey, Salinas, Cal. No. 625,445. Dated May 23, 1899. This invention relates to linotype or line-casting machines, in which lines of matrices are assembled and the metal afterwards cast against them to form a complete line of type. As usually constructed the molds in this class of machines have a channel of fixed width, and any change in the width and size of the line to be cast necessitates the removal of the mold and the insertion of another and expensive mold having a a different width of channel and liner, all of which is troublesome and expensive. The mold has a liner with portions of unequal thickness, one adapted to fill the channel in the mold and the other to partially fill and form a wall of said channel, and a tongue-and-groove connection is made between the two portions of the liner and the adjacent faces of the channel. Means are contrived by which the two parts of the mold are locked together, a means for introducing and removing the liner transversely.

CARTRIDGES. — John P. Elliott, Martinez, Cal. No. 625,440. Dated May 21, 1899. This invention relates to a device for the discharge of projectiles containing high explosives in such a manner that the initial impulse of the projectile will not be accompanied by such a shock as will tend to explode the charge within it before it leaves the gun. To avoid this objection, the cartridge may be formed containing the projectile and the impelling charge of powder in a single structure, or the gun may be formed with the projectile and charge chambers connected, so as to produce the same results. In either case the diameter of the powder chamber is much less than that of the projectile. The firing pin is so arranged that the ignition of the impelling charge takes place at the front of the smaller powder chamber, and the charge is turned from this point toward the rear, so that the projectile is started at a comparatively slow rate of speed, and the increasing expansion of the burning charge of powder increasing the velocity from the starting point to the muzzle of the gun, where it attains its highest speed, but the movement is so gradually communicated that there is not enough shot to explode the charge of high explosive in the projectile. A cushion of suitable material is interposed between the powder chamber and base of the chamber to further relieve the shot of the preliminary ignition of the charge.

Personal.

E. M. SPARHAWK represents the Carnegie Steel Works at Denver, Colo.

C. D. COLFAX, of the Calumet & Hecla mines, is in Idaho examining mining properties.

R. C. CHAMBERS has returned to Park City, Utah, after a visit in San Francisco, Cal.

CAPT. THOMAS MEIN, who recently went to Alaska, returned to Tacoma, seriously ill.

C. F. VON PETERSDORF, formerly of California, is employed at the Ibex, Leadville, Colo.

P. BAUMGARD of Angels leaves for Alaska this week. He spent last summer in the north.

W. S. GRAHAM is employed in mapping the Ralston Divide mine in El Dorado county, Cal.

J. G. ENGLISH, owner of the Golconda mine and mill, Bourne, Oregon, was in Denver, Colo., on the 25th ult.

A. J. KING, formerly with the Jackson Drill and Manufacturing Co., Denver, Colo., has gone to Mexico by way of El Paso, Texas.

J. H. HENLEY, formerly Supt. of the Drum Lummon mine, Marysville, Mont., is now Supt. of the Ibex mines at Leadville, Colo.

LUTHER WAGONER has gone to Mariposa county to superintend the reopening of the Francis mine, eight miles below the town of Mariposa.

G. ALBERS, until recently foreman of the App mine at Quartz Mountain, Cal., has gone to Sierra county, Cal., to superintend the Mountain Gold mine.

PATRICK REDDY of San Francisco, Cal., is in Wallace, Idaho, as counsel for the Union miners recently arrested by the military authorities, accused of destroying the mill and other property of the Bunker Hill & Sullivan Co.

THE Harriman scientific expedition recently organized for a tour of Alaskan waters left Portland, Or., on the afternoon of May 30th for the north. The personnel of the expedition is made up of the following: E. H. Harriman, patron of the expedition; W. H. Brewer, Yale University; J. Burroughs, ornithologist, West Park, N. Y.; W. R. Coe, Ph.D., Ass't Prof. of comparative anatomy, Yale University; L. J. Cole, taxidermist, Ann Arbor, Mich.; F. V. Colville, botanist of the Department of Agriculture, Washington, D. C.; Dr. W. H. Dall, honorary curator of mollusks in the National Museum, Washington, D. C.; F. S. Dellenbaugh, artist, Cragsmore, N. Y.; W. D. Devereux, mining engineer, Glenwood Springs, Colo.; Miss D. Draper, New York City; D. G. Elliott, curator of zoology in the Field Columbian Museum, Chicago; B. K. Emerson, Prof. of geology in Amherst College, Amherst, Mass.; B. E. Fernow, Prof. of forestry of Cornell University; Dr. A. K. Fisher, ornithologist of the U. S. Biological Survey, Washington, D. C.; L. A. Fuertes, bird artist, Ithaca, N. Y.; H. Gannett, chief geographer of the U. S. Geographical Survey, Washington, D. C.; R. S. Gifford, artist, New York City; G. K. Gilbert, geologist of the U. S. Geological Survey, Washington, D. C.; Dr. G. B. Grennell, editor of *Forest and Stream*, New York; J. H. Jones, stenographer, Washington, D. C.; T. H. Kearney, Jr., assistant botanist of the Department of Agriculture, Washington, D. C.; C. A. Keeler, ornithologist, director of the Museum of California Academy of Sciences, San Francisco, Cal.; Capt. L. S. Kelly, scout, Yellowstone National Park; T. Kincaid, entomologist, Seattle, Wash.; Dr. C. H. Merriam, chief of the U. S. Biological Survey, Washington, D. C.; Dr. L. Morris, physician, New York City; W. E. Ritter, Prof. of biology in the University of California, Berkeley, Cal.; J. Muir, specialist on glaciers, Martinez, Cal.; Rev. Dr. G. F. Nelson, chaplain, New York City; Dr. C. Palanche, geologist of Harvard University, Cambridge; R. Ridgeway, curator of birds in the National Museum, Washington, D. C.; De Allon Saunders, botanist of the South Dakota Experiment Station; E. C. Starks of the U. S. Biological Survey, Washington, D. C.; L. F. Timmerman, New York City; Dr. W. Treleaz, director of Shaw's Botanic Gardens, St. Louis; Dr. E. L. Trudeau, Jr., assistant physician at Saranac Lake, N. Y.; Mrs. Harriman, Mrs. M., Cornelia, Carol and W. Averill and R. Harriman of Arden, N. Y.; W. H. Averill, Mrs. Averill and Miss E. Averill of Rochester, N. Y.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING MAY 23, 1899.

625,638.—TANNING—J. R. & J. S. Brown, Alameda, Cal.

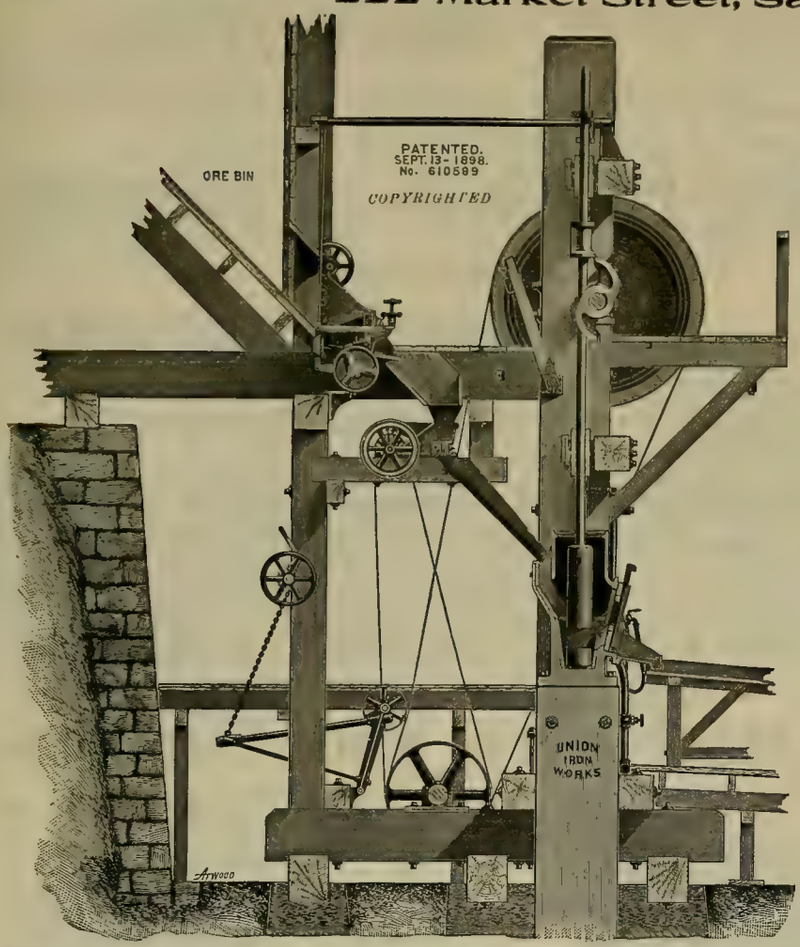
NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.



THIS ILLUSTRATION

Shows our patent Improved Stamp Mill, with Secondary Crusher, which increases the capacity of the ordinary stamp battery from 25 to 30 per cent.

We respectfully invite the attention of those contemplating the erection of new mills to this practical improvement.

For particulars address

UNION IRON WORKS,

222 MARKET ST., SAN FRANCISCO, CAL.

THE CAMMETT CONCENTRATOR.

THE MOST RECENTLY DEVELOPED AND SCIENTIFICALLY DESIGNED CONCENTRATOR ON THE MARKET.

Capacity—15 to 30 Tons Per Day.

PRICE, with all extra attachments, $450, DENVER, COLO.

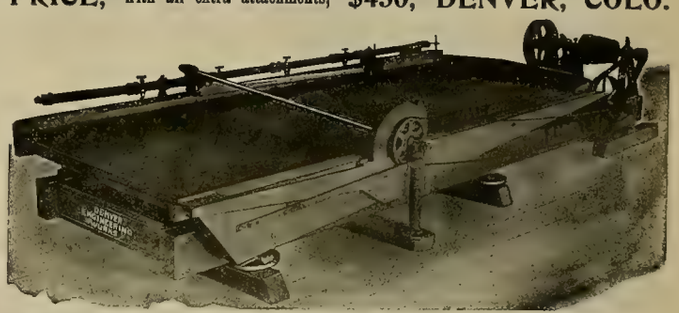
YOU ARE A MILLMAN,

or you would not be looking at this ad.

YOU ARE AN INTELLIGENT ONE,

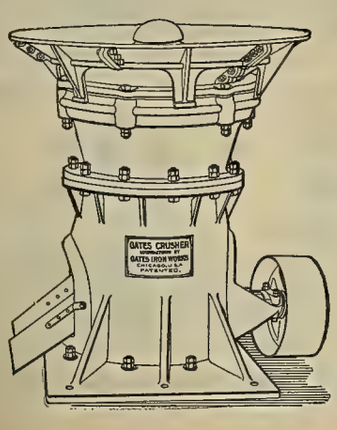
because having naturally seen the picture first, your instinct said, "That's a good looking machine," and you are reading this to find out about it, which proves our judgment of your intelligence is correct.

Our circular will tell you more. Write for it—it's free.



DENVER ENGINEERING WORKS, Sole Manufacturer, DENVER, COLORADO, U. S. A.

GATES IRON WORKS.



The Original GYRATORY BREAKER.

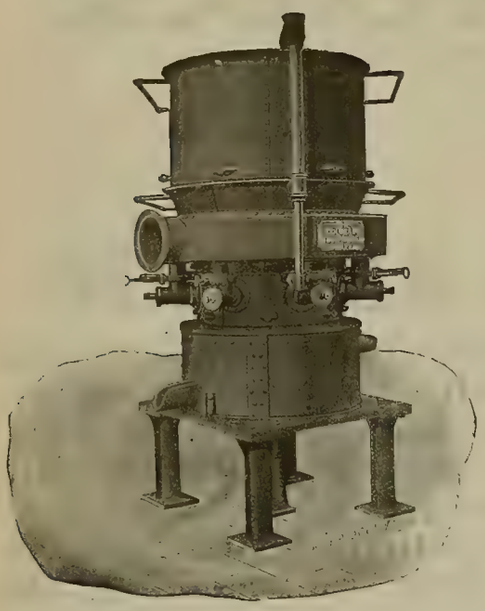
It is ADJUSTABLE, and INDESTRUCTIBLE.

THERE ARE 4,000 OF THEM IN USE.

The South African Mines Have Purchased 200.

. . We build a FINE CRUSHER that is a wonder. . We know how to design this class of machinery. . . . There are others who think they know how to make a Gyratory Crusher; they are simply poor imitators of The Only Great Gates Rock and Ore Breaker. .

Address for Catalogue No. 1, Dept. UU, 650 Elston Ave., CHICAGO.



A MODERN COPPER SMELTER (ROUND FORM).

THE COLORADO IRON WORKS CO.,

Established 1860. DENVER, COLO.

MANUFACTURERS OF

Smelting Furnaces and Equipments

For the Treatment of

GOLD, SILVER, LEAD, COPPER and PYRITIC ORES.

THIS CLASS OF WORK IS A SPECIALTY WITH US.

We also manufacture all kinds of Ore Milling Equipments for Amalgamation, Concentration, Cyanide and Chlorination Processes.

WOODBURY'S IMPERIAL CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well-known belt or bumping table types of concentrators.

SIMPLE IN ITS CONSTRUCTION. | SAVES FINE SULPHURETS.

WITHOUT LOSS IN TAILINGS.

MAKES HIGH PRODUCT. | CAPACITY FROM 5 TO 10 STAMPS.

Sole Manufacturers of

Kendall's Patent Quartz Mills.

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are enabled to offer these mills at **Greatly Reduced Prices.** Having made and sold these mills for the past 16 years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap and durable mill that will do all that is claimed for it and give entire satisfaction.

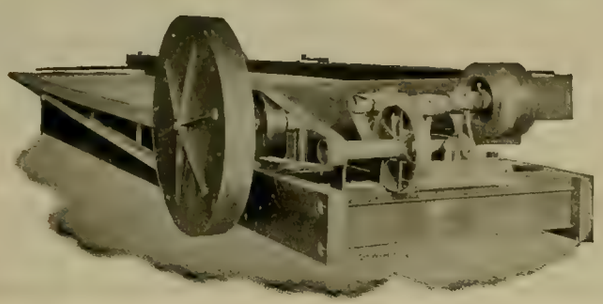
Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.



The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

—— SEND FOR CIRCULARS. ——

These Machines are Kept in Stock Ready for Immediate Shipment.

MINING AND MILLING MACHINERY.

DOUBLE CYLINDER SINGLE DRUM HOIST.

THE above form of Hoist has certain features of construction which make it superior to all others. It is mounted on a single solid base, with standboard for the operator. The engines are reversible link-motion and the drum is fitted with post-brakes and helical teeth, which assure quick and safe operation. The design is compact and superior and the construction strong and substantial. We furnish them either with or without clutch pinions. The above cut illustrates an 8½ inch by 10 inch. Other sizes in stock and built to order.

TURBINE AND CASCADE WATER WHEEL

Hoisting from the 2600-foot level with

..Our Baby Hoist..

A remarkable record==don't you think?

READ WHAT THE SUPERINTENDENT OF COLORADO'S DEEPEST MINE SAYS:

THE GEYSER MINING AND MILLING CO., SILVER CLIFF, COLO.

The Hendrie & Bolthoff M'f'g & Supply Co., Denver, Colo.—GENTLEMEN: It may be of interest to you to know that we are now down 2600 feet with your Baby Hoist (4x6 Double Cylinder) which we purchased some time since. With this engine we are now handling the rock and ore broken by three shifts of four men each, and have had no difficulty whatever in so doing.

This engine stands in our 2400-foot level and is hoisting from the 2600-foot level. It is operated by air.

Very truly yours, W. J. ELMENDORF, Superintendent.

St. Valentine's Day, 1899.

We are selling these on a guarantee to hoist 1000 pounds 200 feet per minute from a depth of 350 feet.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

An Improvement in Modern Stamp Mill Practice

GLOBE BATTERY STEM GUIDE.

PATENTED AUGUST 24, 1897.

RIGID. SIMPLE. DURABLE. EFFICIENT. ECONOMICAL.

Effect a Saving in Friction Losses. No Trouble to Install. No Alterations of Mill Necessary. No Keys or Wedges to Adjust.

Manufactured only by GLOBE IRON WORKS, STOCKTON, CAL., U. S. A.

Manufacturers of All Classes of Mining Machinery. Estimates Furnished.

OFFICE OF WILDMAN GOLD MINING COMPANY, SUTTER CREEK, CAL., June 28, 1898.

Globe Iron Works, corner Main and Commerce Streets, Stockton, Cal.—GENTLEMEN: Replying to your inquiry about the Globe Patent Battery Stem Guides furnished us by you last fall, will say that you supplied us with Guides enough for ten stamps of the Wildman Mill. These Guides have been in constant use for the past eight months, and so far **do not show any wear either on the Guides or the Stems.** They are more convenient than any Guide I ever handled, and much time is saved with them in changing stems, etc. The Guide can be set so close you always get a fair blow on your dies, and the use of these Guides materially increases the crushing capacity of your batteries. **It is our intention to replace all of our Guides with those of your make,** and I cheerfully recommend them to any one desiring a good, serviceable and economical Guide. Very truly yours, JOHN ROSS, JR., Superintendent.

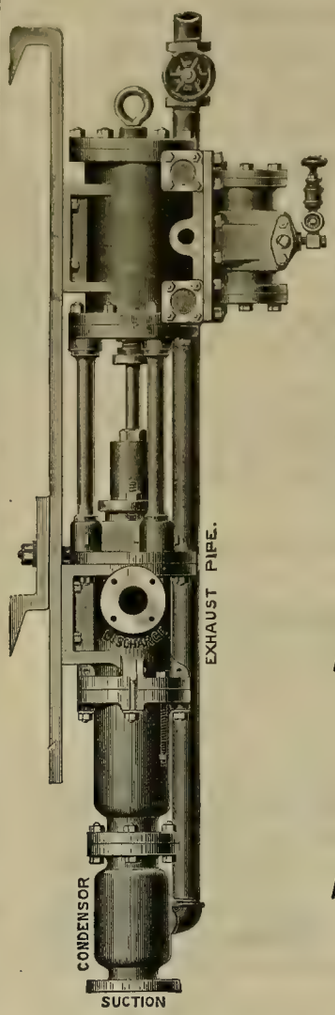
Dewey, Strong & Co., Patent Agents,

330 Market St., San Francisco, Cal.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

"A Sinker!!"



A good steam sinking pump should be

Compact,
Double acting,
Free from outside gearing,
Strongly built,
Light and well arranged for handling.

And should have large valve areas and valves easy of access.

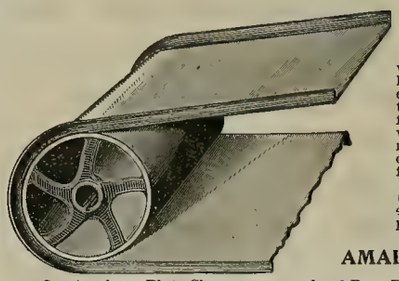
ADAM SCHILLING & SONS, 211 & 213 MAIN STREET, SAN FRANCISCO, CAL.

SPADONE'S CONCENTRATOR BELTS.

PATENTED.



This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and ½ inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

Send us your order for Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING, RUBBER PACKING and LEATHER BELTING.

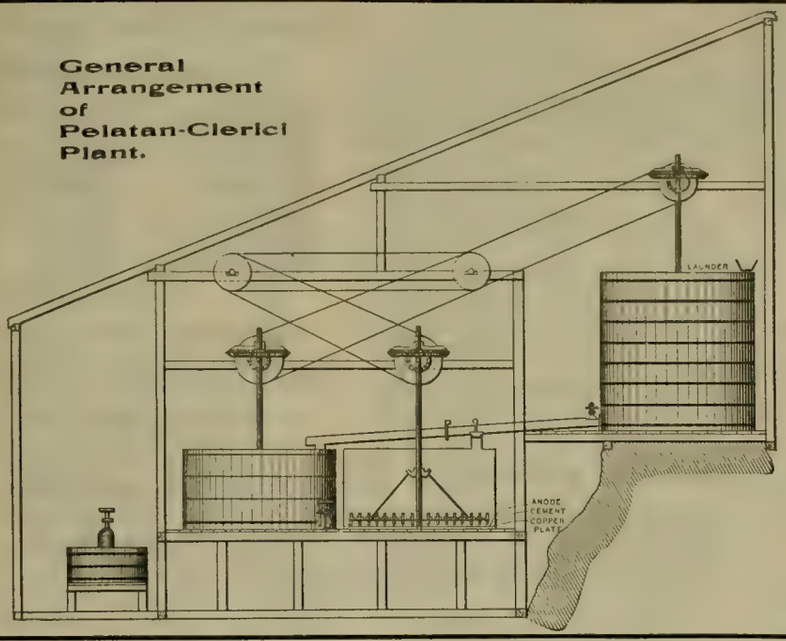
General Arrangement of Pelatan-Clerici Plant.



The "Pelatan-Clerici" Process

OF TREATING REFRACTORY ORES

Saves the precious metals by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process from raw material at less cost The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge. Several mills saving over 90 per cent of values by bullion returns. Simplicity. Economy. Efficiency.

Industrial Notes.

—The iron works at Hantgan, China, employ 2000 men. The plant cost $4,000,000. Only nineteen Europeans are employed.

—The Phœnix Bridge Co. of New York has received a contract from Japan to build a large steel bridge for the Imperial Railway. The bridge will weigh upwards of 1,000,000 pounds and will be the largest steel bridge ever contracted for by American builders.

—The Grand Central Railroad of England has ordered twenty American locomotives to be delivered during the current year. They are to be freight engines of the same character and design as those now under construction for the Midland Railway of England.—Boston Financial News.

Assessment Notices.

THE OLD BONANZA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of April, 1899, an assessment (No. 1) of two and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 163 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of May, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 10th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 1) has been postponed to SATURDAY, the 10th day of June, 1899, and the day of sale from the 10th day of June, 1899, to SATURDAY, the 8th day of July, 1899.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, California.

MAYDAY GOLD AND SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 31st day of May, 1899, an assessment (No. 2) of ten cents (10c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 24 Post street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of July, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 23th day of August, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. P. HEALD, Secretary.

Office—Heald's Business College, 24 Post street, San Francisco, California.

MARGUERITE GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of May, 1899, an assessment (No. 13) of Ten Cents (10c.) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 237 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 12th day of June, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 10th day of July, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

F. METTMANN, Secretary.

Office—237 12th street, San Francisco, California.

The Secretary will also receive payments from 12 to 5 P. M. at his business office, 225 Sansome street.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of May, 1899, an assessment (No. 19) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of June, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 3rd day of July, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, Cal.

BOULDER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of May, 1899, an assessment (No. 3) of three cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 163 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of July, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 27th day of July, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

Office—163 Crocker building, San Francisco, Cal.

BADGER HILL AND CHEROKEE GRAVEL MINING Company.—Location of principal place of business, San Francisco, California; location of works, Cherokee, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of May, 1899, an assessment of Three Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of June, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 27th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

ARRASTRAVILLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of May, 1899, an assessment (No. 3) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 213 Jackson street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of June, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 11th day of July, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. MIDDLETON, Secretary.

Office—213 Jackson street, San Francisco, Cal.

CENTRAL EUREKA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sutter Creek, Amador County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 26th day of May, 1899, an assessment (No. 12) of two cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 9, 320 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3d day of July, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 24th day of July, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

WM. A. M. VAN BOKKELEN, Secretary.

Office—Room 9, 320 Sansome street, San Francisco, California.

Stockholders' Meeting.

Notice of Stockholders' Meeting of the Union Hill Consolidated Mines.—In accordance with a resolution passed by the Board of Directors of the Union Hill Consolidated mines, a meeting of the stockholders of this company will be held at 11 o'clock in the forenoon on WEDNESDAY, the 12th day of July, 1899, at its principal office, 320 Sansome street, room 24, San Francisco, California, to consider and vote upon a proposition to increase the capital stock of this company to Two Hundred Thousand ($200,000.00) Dollars in 200,000 shares at the par value of One Dollar each.

Dated: San Francisco, May 25th, 1899.

JOSEPH H. MOOSER, Secretary.

ANNUAL MEETING.

The Regular Annual Meeting of the Stockholders of the NATIONAL CON. MINING CO. will be held at the office of the Company, 773 Mission St., San Francisco, California, on MONDAY, the 5th day of June, 1899, at the hour of 8 P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the Meeting.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California.

SPECIAL MEETING.—A special meeting of the stockholders of the Electric Placer Mining Co. will be held at the office of the company, 204 McAllister street, room 12, San Francisco, Cal., on SATURDAY, June 17th, 1899, at 2 o'clock P. M.

A. R. VINING, Secretary.

DIVIDEND NOTICE.

Mead Gold Mining and Milling Co.—A regular quarterly dividend (No. 3) at the rate of forty (40) per cent per annum on the par value of the issued capital stock of the company has been declared, payable after June 1, 1899, at the office of the company, 411 Claus Spreckels building, San Francisco. Transfer books close May 28, 1899.

J. C. JENS, President.

G. GALL, Secretary.

DIVIDEND NOTICE.

Boston & California Gold Mining and Milling Co.—A regular quarterly dividend (No. 2) at the rate of six (6) per cent per annum on the par value of the issued capital stock of the company has been declared, payable after June 1, 1899, at the office of the company, 411 Claus Spreckels building, San Francisco. Transfer books close May 28, 1899.

J. C. JENS, President.

G. GALL, Secretary.

INVENTORS, Take Notice!

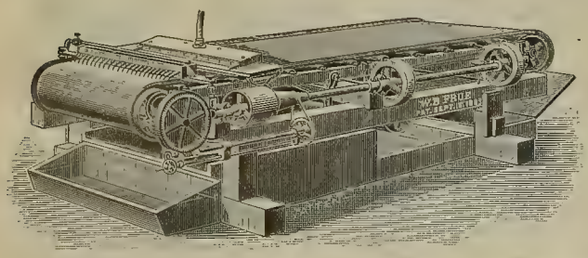
FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.



STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

The Cyanide Process.

How general the application of the cyanide process will become is a matter for the future to determine. In its early history it was thought that it could be successfully applied to almost every class of ore, but it was soon demonstrated that this was not a fact; the tide turned in the other direction and it was then thought that its range of application was limited to a few ores particularly adapted to it. Since then several years of experiment and successful application has broadened its field of operation very materially and at this time it cannot be said with assurance that it will not cover a still wider field.

In no other place, perhaps, has an absolute confidence in its ultimate success been better demonstrated than in Montana. After repeated and expensive failure every difficulty has been overcome in several localities, and where first it was an absolute failure it is now an unqualified success.

Experiments are constantly being made in the chemistry of the process and in its mechanical application. It has long since become evident that no one method will make it applicable to all ores or all conditions, but the process is a rational one and one which will not only endure, but will find much improvement in the future. The precipitation of gold on shavings, threads and granulated particles of zinc is not all that can be desired, but improvements may still be anticipated in this branch of the process. Electricity in some modifications of the process is already playing an important part and further development may be looked for in this direction.

Slimes of the most dense and impervious character are now successfully treated by agitation and decantation where vacuum filters and pressure tanks failed absolutely to produce the desired results. The illustration on this page of the agitator in a Montana mill shows one phase of the process in the treatment of slimes which will be found described on page 609. The contrivance used to secure a uniform agitation of the pulp is another ingenious device—the outcome of the necessities of the case. These are only isolated examples which exemplify the fertility of resource of the men who have made and are still making the history of the cyanide process.

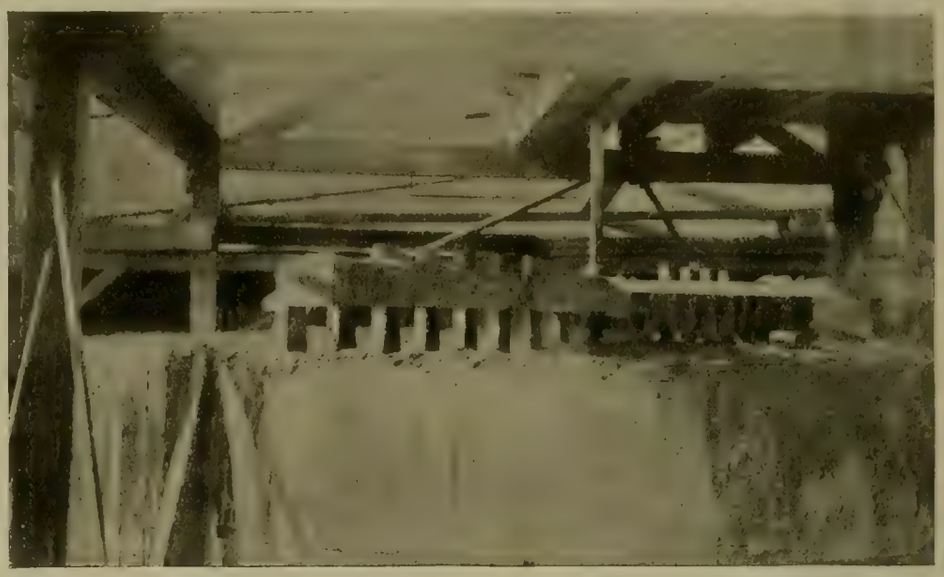

FIG. 3.—AGITATOR IN MOTION, FULL TO THE BRIM. (See page 612.)

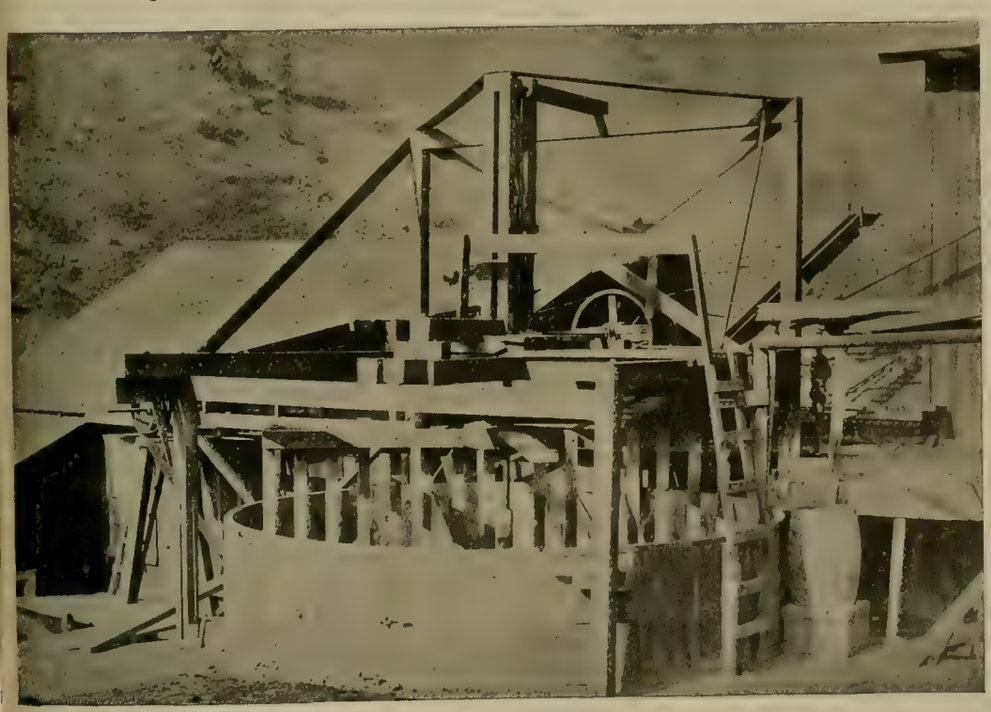

FIG. 2.—AGITATOR, READY TO LOAD, MOHEGAN MILL, MONTANA. (See page 612.)

Searching for Diamonds.

Considerable interest has been taken of late by geologists and scientific men generally in the occurrence and probable origin of diamonds. They are known to have a very wide distribution in numerous countries of the world, but under apparently greatly varying conditions. There seems to be little in common in the genesis of the South African gems and those of Brazil. In the aggregate a large number of diamonds have been found it California placer mines and there is not the slightest doubt that many more would have been obtained had miners been searching for them. All, or nearly all found to this date, were accidently discovered, no systematic effort to find them ever having been made. If it can be determined by scientific investigation what really is the genesis of the diamond—how it was formed and under what conditions to expect to find it, search for it in new fields might result in its discovery elsewhere. In California the diamond has been found in regions in which serpentine is more or less abundant, and in this regard it suggests an approach to the South African occurrence where the matrix is essentially serpentine or rock of similar lithological character. In America and in Brazil the diamond is usually found in a region tributary to coarse crystalline rocks, as pegmatite granite veins, and a certain micaceous sandstone noted for being flexible. This latter is common in the Brazil diamond fields, and it has also been found in the ancient river channels of California, notably in the Happy valley channel a mile east of Mokelumne Hill in Calaveras county, though no diamonds are reported from that vicinity. This channel, however, undoubtedly came from the direction of Rancheria and Volcano in Amador county, where diamonds were found. The channels where diamonds were discovered near these last named localities are filled with metamorphic rocks, chiefly schists, quartzites, etc., characteristic of the Calaveras formation.

As diamonds in California up to this time have been found by merest accidents, it is not unreasonable to believe a more careful search of the material of the sluices by miners may result in finding larger and more valuable gems than have yet been discovered in this State. The value of diamonds found in the State thus far aggregates several thousand dollars.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Agitator, Ready to Load, Southern Cross Mine, Montana; Agitator in Motion, Full to the Brim, Southern Cross Mine, Montana, 609. Propeller for Agitator, Southern Cross Mine, Montana, 612. Latest Mining and Metallurgical Patents, 614.

EDITORIAL.—The Cyanide Process; Searching for Diamonds, 609. The Cost of Mining; An Official Location Notice; Arizona Enjoying a Boom in Mining; Iron and Steel Exports from the United States; Largely Increased Foreign Trade; Convention of American Institute of Mining Engineers; Miscellaneous, 610.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 617-618.

THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 630.

MISCELLANEOUS.—Concentrates, 611. Cyaniding Slimy Ores and Tailings; Tamarack Dividends; Some Experiences of a Working Miner, 612. The Occurrence and Origin of Diamonds in California; Some Characteristic Mines of the California Gold Belt, 613. Latest Mining and Metallurgical Patents; The Eight-Hour Law in Colorado, 614. When Is an Undertaking Feasible? Aluminum Feed Wires; A New Building Material in Germany; No Summer Shutdown in Iron and Steel Mills; Industrial Notes; Personal; Recent Mining Incorporations; Commercial Paragraphs; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 615. The MacArthur-Forrest Cyanide Process; The Milling of Arsenical Gold Ores; Copper Salts on Amalgamated Copper Plates; A New Abrasive; Homestake Mining Company, 616.

PROSPECTORS in Calaveras county, Cal., have again demonstrated the usefulness of the well-boring drill in prospecting for gravel near Camanche, where in a hole 160 feet in depth they have discovered 20 feet of gold-bearing gravel.

AN effort is being made by Secretary Hay to reach an agreement with England which will temporarily, at least, arrange the disputed boundary question in Alaska, so as to end the existing trouble between American and English miners.

A CORRESPONDENT of the London *Mining Journal* insists that his estimate that $250,000,000 lie in the auriferous belt south of Bendigo, Australia, is too small, and he believes that an estimate of $1,000,000,000 in the mines of Victoria wholly within bounds.

BRITISH COLUMBIA miners in several camps have walked out, refusing to stand the cut in wages which followed the introduction of the eight-hour law. Thus far no trouble is reported. There is no objection on the part of the miners to the eight-hour shift but they demand the same pay for eight hours that they have previously received for ten.

A MORE complicated condition of affairs than appears to exist in the veins of Rossland, B. C., it would be difficult to find. The veins vary greatly in strike and dip and are dislocated by at least two series of faults, which do not tend to simplify matters. Where such a complex exists the extra-lateral right law is almost sure to result in litigation if there are adjoining interests.

THE statement of the president of a prominent Colorado mine which has paid several dividends and in which rich strikes were reported not long since, that the lower levels are looking badly and that the ore, while there in great quantity, is too low grade to pay, seems for some reason to be viewed by the public of Colorado with suspicion. Such candid statements, they argue, are unnatural.

THE idle, restless element which is usually found in mining camps everywhere in the western part of the United States have a choice of three fields to "rush to" this season, and although a great many are on the move the rush has in no case yet reached the proportions of a stampede. The three new fields are La Cerro Pintado in Lower California, Cape Nome in Alaska, and the Buffalo Hump field in Idaho. At this writing it is difficult to say which place will receive the most attention, but large numbers are already going to each of these fields.

The Cost of Mining.

A question frequently asked is, "How cheaply can a mine be worked in California?" There are so many factors entering into the economy of mine equipment, development and management that no arbitrary answer can be given this question. An important consideration is the width of the vein. Another question of almost equal importance is the character of the rock, whether hard or soft, easily supported or requiring close and immediate filling. Still another consideration of great importance is the manner of recovering the ore bodies, whether by means of tunnels or through shafts. The quantity of water, cost of timber, cost of labor and supplies, distance from mine to mill, kind of motive power and its cost—all of these are important considerations which have a direct bearing on the cost of mining. The beneficiation of the ore is a distinct branch and a large number of conditions have to be considered. Here the hardness of the ore has a direct effect on crushing capacity, but large capacity per stamp is not always productive of the best results. The fineness of the gold or its association with other minerals determines in a large measure the capacity of the mill. A free milling quartz can be milled more cheaply than one which is only partly free and requires concentration or other subsequent treatment. Some ores cannot be successfully milled at all, or at least milling cannot successfully compete with smelting.

To obtain the best results at the lowest cost is the object throughout, and to accomplish this result requires a careful consideration of equipment and methods of mining to be pursued. The ore, having been brought to the surface with as little handling as possible, should reach the mill as quickly as possible, and when dumped on the grizzlies it should pass automatically downward by gravity from one operation to another, until the pulp passes to waste down the gulch, having been relieved of all the precious metal it is economy to extract. Under favorable circumstances mines have been operated in California at less than 50 cents per ton, this covering all cost of mining, milling, etc., but in these operations the ore bodies were extensive and were mined in the open cuts; the tonnage per stamp was large, the rock an ideal free milling material, and the power employed free water.

An Official Location Notice.

Some weeks ago the MINING AND SCIENTIFIC PRESS suggested the advisability of the California State Miners' Association taking up the matter of the location of mines and simplifying this vexing problem of the prospector by the drafting of blank location notices of simple and proper form, which would at once become a recognized authority, and all locations made under them would be made in similar manner and thus would be avoided much of the litigation arising from improper location of claims. The California State Miners' Association has acted in this matter, and, as a result of the labor of Secretary E. H. Benjamin and the attorney for the Association, blanks have been drawn which have passed through and stood the test of the Supreme Court of the State. The blanks are of three kinds—for quartz and placer mine locations and for mill sites. They will soon be ready and may be had by members of the Association in good standing without cost upon application to the secretary.

ARIZONA has of late been enjoying something of a boom in mining. Ten years ago there were only a few gold mines in the entire Territory paying and now there are a number in each of several counties of the Territory. The hills east and southeast of Prescott are full of veins containing gold and silver ores and near the head of the Hassayampa copper also is prominent. There are a few mines developed to a point that would be called deep in other mining regions. The mines of Arizona without doubt will be found to go as deep as mines elsewhere. The fact that large amounts of gold have been found on the surface of the ground and near it is due more to the peculiar climatic conditions, particularly the character of the rainfall, than to any peculiarity of the geology of the region. All along the Hassayampa creek; in the Bradshaws, on the Santa Maria and near the Agua Fria, gold and silver veins are known which require development to prove their real worth and in many cases the surface prospects justify the expense.

THE largest increase in exports of manufactures from the United States is in iron and steel and manufactures thereof. The recent advance in prices of iron and steel led many to believe that our exports in those lines would fall off, but it appears that prices abroad have advanced in about the same proportion as in the United States, and that consequently the increase in price rather increased the number of dollars worth of material exported. At least the figures of the Treasury Bureau of Statistics show that in the ten months ending with April, '99, the exports of iron and steel and manufactures thereof have amounted to $76,251,736, against $56,264,165 in the corresponding ten months of '98, $46,565,116 in the corresponding months of '97, and $33,365,674 in the ten months of '96. Thus exports of iron and steel have increased 35% in the past year and have considerably more than doubled in four years.

AMERICAN manufacturers, particularly in the iron industries, are leading the world in the competitive race for trade. The secret of the largely increased foreign trade lies in the fact that they study the wants of the customers they desire to secure, and if standard shapes and sizes do not suit, the American manufacturer will make those which will suit. A London industrial journal says that "British manufacturers have lost two important orders for South Africa. Galvanized barb wire is in great demand, and America put in a price 20% below ours. For 40,000 tons of rails they got below our price to the same extent, and a large order for tubing was captured from a Scotch firm, who refused to make them in longer lengths than usual. These orders reached the total of half a million, and there are others of even greater value to follow shortly."

THE American Institute of Mining Engineers will convene in San Francisco, Cal., on Sept. 25th, '99. Arrangements for their reception and entertainment while in this State are being rapidly perfected and it will without doubt be one of the most pleasureable meetings ever held by the Institute. Arrangements have been made to have the members visit and inspect a number of the most important mining districts of this State and on their return eastward those who desire will have an opportunity to see some of the most important mines of Arizona. While in California several side trips to Yosemite, Big Trees and other points of interest are planned.

A PROPOSITION is before the State Legislature of Michigan in the form of a bill providing for a tax upon copper output, the terms of which are as follows: On mines producing over 50,000,000 pounds of copper per year, ½ cent per pound; on mines producing 10,000,000 to 50,000,000 pounds, ¼ cent per pound; on mines producing between 5,000,000 and 10,000,000 pounds, ⅛ cent per pound, and on mines producing less than 5,000,000 pounds, $\frac{1}{16}$ cent per pound. Whether the purpose of the bill is for revenue only or for other purposes of a political nature cannot be stated but the copper companies will offer a vigorous resistance to the proposed legislation.

WITH practically no exception, the system of eight-hour shifts was inaugurated in Colorado mines on June 1st. In many cases the plan was previously in vogue and needed no change. Thus far the wages remain generally the same for a day of eight hours as they formerly were for ten hours. The only exception noted is at Ward, Boulder county, where the scale by the hour effected a slight reduction per day. The result was a declination on the part of the miners to go to work.

ALUMINUM wires for transmission of electric currents have commenced to come into use and threaten to displace the further employment of copper for this purpose. The cost of the aluminum wire is 36 cents per pound and that of copper wire about 20 cents. As forty-seven pounds of aluminum wire can be made to replace 100 pounds of copper wire, it will repay some electric companies to replace their copper lines with aluminum, leaving a profit from the sale of the copper.

Concentrates.

IN electricity mica is occasionally employed as an insulator.

HYDRAULIC sizers are of inestimable value in concentrating ores.

WATER in a state of rest exerts pressure equally in all directions.

NATIVE LEAD is found in a few places only. It is claimed to have been found in Canada.

IN California twenty-eight mines, after an idleness of years, have been reopened successfully.

ON Sulphur creek, California, in Lake county, cinnabar is found in commercial quantities in basalt.

ANY inaccuracy in the survey of a mining claim may be investigated through the office of the Surveyor General.

CLAY is an aluminous silicate. Bauxite is an oxide of alumina and is used chiefly in the manufacture of aluminum.

WROUGHT-IRON pipe for carrying water should be coated outside and inside with asphaltum or coal tar or it will be short lived.

NO SAMPLE is of value which does not exactly represent the condition of the vein at the place where such sample was taken.

AN acre of land is about 208.7 feet square and contains 43,560 cubic feet. There are 20.661+ acres in a mining claim 1500x600 feet.

IT is said that rods of soft iron, when having stood in vertical position many years—as bars on a window—become magnetized.

AN automobile wagon recently made the trip from Cleveland, Ohio, to Albany, New York, a distance of 546 miles in thirty-seven hours and forty minutes.

THE only important tin producing region of Europe at present is Cornwall, England. Tin is also produced in Germany, Spain, Portugal and Finland.

A DEVICE has been invented to transmit messages electrically without the aid of wires, flashes of light being substituted for the sounder of the telegraph instrument.

YUCCA has been used to support ground in mine excavations in a few instances only on the Mojave desert. The ground and country are very dry and the rock stands well without timber.

THE surface velocity of water running in a flume or ditch of uniform size may be used to determine its volume of discharge, approximately, by multiplying the velocity by the average cross section.

THE courts have ruled that it is erroneous in making mining locations to make the end lines of a claim overlap the end lines of a claim previously located, for the purpose of making the end lines parallel.

CANVAS can be made waterproof by applying a mixture of gelatine, 50 grammes, boiled in 3 liters of water; alum, 100 grammes, dissolved in three liters of water; soda soap dissolved is 2 liters of water.

THE pressure of water on the sides of a vessel is equal to the weight of a column of water whose base is equal to the area of the side of the vessel, and whose height is equal to one-half the depth of the liquid.

AN armature is a mass of iron or steel, or a collection of pieces of iron designed to be acted upon by a magnet. Nickel and cobalt may also be used for the same purpose, but are not, excepting in experimental work.

A CAP SILL is a timber sometimes used in the square set system, and is so placed that one end rests in a hitch cut into the foot wall, the opposite end being placed on a post, and performing the functions of a cap.

A MONTANA court has fined the Anaconda Copper Co. $300 for failure to provide their mine cages with hoods for the protection of men. This is the minimum penalty. The company will appeal the case on a technicality.

IT is customary to have the riffles in a well-constructed sluice somewhat higher in the center than at the sides, for the reason that the largest amount of boulders and gravel travels along the center, where the current is greatest.

THE use of large timbers in the square set system has been largely discontinued, those of smaller dimensions being substituted, followed by filling, it having been demonstrated that no amount of timber will sustain the weight of a mountain.

COMPRESSED air locomotives have been introduced into the coal mines of Pennsylvania owned by the H. C. Frick Co. The engines are to be charged on each trip down and up the slope by means of an air compressor located at the foot of the main shaft.

FOR underground use a steel plate at the intersection of drifts is much better than a turntable. Where the expense is not too great, it pays to cut out the ground so as to turn a right angle on a curve instead of swinging a car on a turn plate or turntable.

ORDINARILY too little attention is paid to ventilation in mines, miners being obliged to work in smoky, gas-laden workings as long as they can stand it. Men cannot accomplish good work economically under such conditions, and it is a matter of economy to provide good air.

CHALCOSTIBITE is a combination of copper, antimony and sulphur and is a comparatively rare mineral. Handsome specimens occur in some of the copper mines of Butte, Montana, and these are rich in silver. The ore is steel gray in color and has a bright, shimmering metallic luster.

THERE is no law in California compelling mine owners to provide a ladder reaching to the foot of a shaft where sinking is in progress, but in case of injury to men by reason of the absence of proper facility to leave the bottom of the shaft the owner would be held responsible in case of lawsuit.

IN Montana the Legislature has enacted a law making the standard of water measurement 1 cubic foot, or 7.48 gallons, per second, 100 inches being equal to 18.79 gallons per second. This is equivalent to the California measurement and equal to a flow of 1¼ cubic feet per inch per minute.

WHEN drift sets require renewal in heavy ground it is always advisable to put in false sets before attempting to take out the old. If much subsidence of the old timbers has occurred prior to removal, the lost ground may sometimes be partly recovered by driving saddle wedges between the posts and caps.

NO CONCENTRATING machine of any type has yet been devised which will separate all classes of material without sizing. The machine that will make a clean saving of coarser heavy particles will not save the slimes of the same material, and the machine which will save the slimes will lose the coarse grains.

A SPRAG is a short timber placed between two larger timbers, usually posts, to afford greater rigidity to timber sets. They are often necessary in shifting ground, particularly in drift sets, where they are placed between the posts longitudinally with the drift, either near the top or bottom of the posts, or both.

A VELOCITY of 16 feet per minute of a stream of water will wear away clay, 30 feet will move fine sand, 40 feet per minute will lift coarse sand, 45 feet moves fine gravel; 120 feet moves pebbles, 320 feet moves cobbles, 400 feet will move rocks 6 to 8 inches in diameter and 600 feet per minute will move bolders 2 feet in diameter.

PROSPECTORS had better give their attention to the search for ores of gold, silver and copper, as when found they return the largest profit at least relative expense. Very few prospectors ever made a fortune by searching for or finding such minerals as molybdenite, wolframite, uranium, iridium, and other rare and high-priced metals and minerals.

AN ohm is the resistance of a column of mercury 1 square millimeter in cross-sectional area and 106.24 centimeters in length. In electricity it is the term used to signify a unit of resistance. The legal ohm is somewhat less than that of the true ohm, being the resistance of a column of mercury 1 square millimeter in area and 106 centimeters long.

THE difference between the terms horse power and actual horse power is the difference between a theoretical and an actual result. A horse power is equal to 33,000 pounds raised by a horse 1 foot in one minute and is termed indicated horse power. The actual horse power of an engine or motor of any kind is usually somewhat less than its theoretical horse power.

IT is unadvisable to attempt to work ore bodies or veins of greater width than 12 feet without employing sills on the floors of levels, owing to the difficulties encountered when it becomes necessary to stope out to the floor above. In smaller veins this may be accomplished by spragging the posts and in other ways, but in large veins these methods cannot be successfully used.

SYENITE is a crystalline rock consisting of orthoclase (potash feldspar) and hornblende, and is distinguished from granite by absence of quartz. When quartz appears in this rock it becomes syenitic granite. The substitution of plagioclase (soda lime) feldspar for orthoclase makes it diorite; and when both orthoclase and plagioclase, with quartz, mica and hornblende occur, it forms grano-diorite.

TO ASCERTAIN the average velocity and discharge of a flume, multiply the area of cross section in square feet by the grade in feet per foot and multiply by 9000. Divide the result by the wet perimeter in feet, and extract the square root. The result will give the mean velocity in feet per second. The area of cross section of the flume multiplied by the velocity gives the discharge in cubic feet per second.

STUDDLE is a Cornish miner's name for a corner post in shaft timbering. A stull is different and has a different use. It is a stick of timber reaching usually from wall to wall of a vein and may be put in for the purpose of supporting the hanging wall or may be placed nearly horizontal for the purpose of forming floors of lagging, which reach from stull to stull, upon which ore or waste are broken down from overhead.

FELSITE is an exceedingly close-grained rock, composed of an intimate mixture of quartz and orthoclase feldspar. So closely are these minerals intermingled that the microscope seldom resolves the crystals into distinct individuals. In some varieties distinct crystals of feldspar occur, when the rock is known as feldspar porphyry. In other varieties quartz blebs are found and it is then known as quartz porphyry.

BASALT consists chiefly of plagioclase, augite, olivine and abundant magnetite, or titaniferous iron. These are essential constituents. Numerous other minerals occur in basalts in small quantities as accessory. Basalt frequently takes a columnar structure, and is found in long prisms having four, five or six sides. The Giant's Causeway, Ireland, is of columnar basalt. There are numerous occurrences of this character in California.

WHEN a pipe line has been completed care should be taken when water is admitted to the pipe to exclude air, as far as possible. This is almost unavoidable and air in great quantities will be sucked in if the necessary precautions are not taken. A gate put in the pipe below the point of entry of the water furnishes a means of regulating the flow. Another method is to fill the pipe from a penstock which is kept full so that the water passes in quietly.

A RULE to find the area of a cross section of a ditch with sloping sides: Add together the width at top and bottom in inches, multiply this sum by the depth in inches and divide this sum by 2. This quotient divided by 144 will give the area in square feet. To find the cross-section area of a ditch or flume whose sides slope to a point at the bottom: Multiply the width at top in inches by half the depth in inches and divide by 144, which will give the area in square feet.

THE caps employed to discharge nitro powders, called commonly giant powder caps, primers, detonators, etc., are charged usually with fulminate of mercury, mixed with niter in the ratio of 1 to 6, or three parts of fulminate with five of chlorate of potash, one of sulphur and one of ground glass. When wet, it may be handled without extreme danger, but when dry it explodes violently upon the slightest abrasion, concussion or by coming in contact with nitric or sulphuric acid. The caps are made of varying strength indicated by marks on the boxes containing them, as X, XX, XXX, etc. These caps should never be kept in contact with or in the neighborhood of nitro powders. More accidental discharges of powder are due to the careless practice of keeping the two together than to other causes.

PROSPECTORS should look out not only for veins of quartz when in search of gold, but also all other rocks which have a vein-like appearance, as dykes of porphyry, etc., particularly where found stained red, brown or yellow by iron oxides, or green by carbonate of copper. A few years ago no one thought of examining dykes in search of gold, but they are now known to be very commonly gold bearing and often contain free gold as well as auriferous iron and other sulphides.

FULLER'S EARTH is a natural composition of silica, alumina and water, with a small amount of lime, magnesia and iron peroxide. The silica is 50%, alumina 20% and the water about 24%. It is a hydrous bisilicate of alumina and has some peculiar properties, notably that of absorbing oil and grease, and is used largely in fulling cloth. At one time it was considered so valuable in England that its exportation was prohibited. The mineral is found in several localities in the United States.

A CHILI MILL is a type of rock-crushing device used originally in Chili, and consists of an upright post secured to a square frame. Extending from the post are arms which travel horizontally, having at their farther end a heavy stone wheel. The rock or ore to be crushed is thrown into a basin having a stone pavement, in the center of which stands the upright post. The wheels are revolved by animal or other power. This device has been imitated by several manufacturers of iron quartz mills.

AMPHIBOLITE SCHIST is a rock derived from the alteration of diabase, diorite or other rock in which augite or hornblende is a primary constituent. In most cases it can be plainly shown that the schistose structure is induced and does not represent the original structure of the rock, for generally the schistose rock can be traced to the massive rock from which it was derived. Amphibolite schist is frequently gold-bearing; and, when so, usually contains auriferous iron sulphide and quartz in small grains.

PYROPHYLLITE is near talc in crystallization, but is an aluminous silicate instead of magnesian. It is white to pale green in color when not stained by iron or other oxides. It is soft and greasy to the touch. It occurs in foliated and fine granular forms, the folia often taking a radial position when they are grouped in clusters of star-like forms. It is found in some abundance in Mariposa county, Cal., on a small peak near the foothills bordering the San Joaquin valley, about six miles southwest of Indian gulch.

THE so-called cannon balls found on the Cannon Ball and Grand rivers in North Dakota are concretionary masses of silicious iron ore formed in the sandstone. They usually appear to have a small nucleal body at the center, probably of organic origin, around which the iron seems to have been deposited often in concentric layers. In size they vary from that of peas to large spherical boulders a foot or more in diameter. Often the sandstone surrounding these iron concretions appears to be almost destitute of iron.

REPLYING to the question from Hedges, Cal., "Does it make any difference at which end of the mortar the count of the sequence of dropping stamps begins?". The succession 1-5-2-4-3 of dropping stamps is undoubtedly a good one and is in common though not exclusive use. That the succession 1-4-2-3-5 is a "poor one," as suggested by Prof. Courtenay DeKalb in his paper entitled "Adjustment and Control of Stamp Mills," which appeared in the issue of May 20th, '99, is not apparent, for the succession 1-5-2-4-3, if viewed from the opposite side of the battery, produces the succession 1-4-2-3-5. It does not make any difference at which end of the mortar the count begins.

LETTERS are still frequently received from those desiring information concerning molybdenite. Molybdenite is the sulphide of molybdenum, a metallic, soft, usually foliated mineral about the color of galena but rather softer. It also occurs massive and granular; is found in granite, gneiss, granular limestone and in other crystalline rocks, and frequently in quartz veins. When associated with gold in veins, as at Meadow Lake, Nevada Co., Cal., it makes the amalgamation of the gold a matter of great difficulty. Molybdenum is used in small quantities in the manufacture of steel. The price is high, but any considerable amount would overstock the market and there would be no sale for it.

SILVER CYANIDE is soluble in an excess of potassium cyanide, and this fact is taken advantage of in testing the strength of cyanide solutions in mills by adding, drop by drop, silver nitrate to a solution of potassium cyanide. At a certain point in the operation of adding silver nitrate to a solution of potassium cyanide the silver becomes insoluble and falls to the bottom of the vessel as a gray precipitate. The quantity of silver nitrate necessary to be added before this precipitation occurs is measured by means of a burette and by it the strength of the cyanide solution determined. For this purpose a standard silver nitrate solution is made by dissolving 13.06 grammes of pure silver nitrate in one liter of pure water.

WHERE a partner or partners in a mining claim refuse to perform their share of the annual assessment work a remedy is provided by the United States statutes. The partner or partners who do not wish to abandon the claim shall perform the full one hundred dollars' worth of assessment work as required by law, and then serve a notice in writing upon the co-partners who have refused to do their share of the work, or by publication in a newspaper nearest the mine if personal service cannot be had, setting forth the fact that the assessment work has been done for the year (stating year), and demanding that they shall, in the language of the law, "within ninety days from the service of this notice (or within ninety days after the publication of this notice) you fail to contribute your proportion of such expenditure as a co-owner, your interest in said claim will become the property of the subscriber under section 2324." At the expiration of 180 days this notice should be recorded, together with the affidavit of the newspaper publisher that the notices were duly and legally published. Accompanying this must be the affidavit of the party who has actually performed or caused to be performed the assessment work, as required by law. This completes his record title.

Cyaniding Slimy Ores and Tailings.

Written for the MINING AND SCIENTIC PRESS by MATT. W. ALDERSON.

Part II.—Agitation.

The first agitator in Montana was a vat 10 feet in diameter, 3½ feet in depth. It worked successfully, and larger sizes were erected. Fig. 2 (see page 609) gives a good idea of one of these. It is a vat 16 feet in diameter by 8 feet in depth, the agitator being so arranged that it may be raised and lowered when in motion. It is operated from above and its speed should be from eight to twelve revolutions per minute. It can be loaded before starting by putting in the tailings, then the solution, and lowering the agitator through the material until all is in motion; or, adding the solution first, the vat can be loaded with tailings while agitating. Twenty tons of a fairly sandy material is a usual charge, or of a very slimy material, about twelve tons.

It will be seen that the agitator has wooden prongs extending downward from a traveling beam. These are simply 2x4's bolted on, they being found to be durable, cheap and easily replaced. Fig. 2 shows the agitator empty, ready to be loaded, and Fig. 3 (see page 609) shows the same in motion and full to the brim. While good work was done with this form of agitator, there was always difficulty in keeping all the contents of the vat in motion, caused by the heavy sands settling to the bottom near the center of the vat, where there was less motion. To remedy this, various expedients were resorted to, cultivator plows and plows of other shapes were attached to the bottoms of the prongs, and, while the material could be moved by them, they did not overcome the difficulty. Finally, it was decided to try the propeller form, and Fig. 4 shows the

FIG. 4.—PROPELLER FOR AGITATOR, SOUTHERN CROSS MINE, MONTANA.

first one, put in at the mill of the Southern Cross mine. It was hewed out of a log of wood and the edges faced with band iron. This was a decided success, and the agitators are now built on this principle, with steel propeller blades. A cast iron hub is made to fit on the bottom of the upright shaft, to which two steel blades are attached with one set of bolts. The blades are heavy boiler steel, 8 inches in width by 8 feet in length. At the central shaft they stand at an angle of 45°, gradually curving like a plowshare to the outer edges of the vat, where they are nearly flat. Two bolts on each side of the shaft hold the blades securely in place. This form of agitator does the work perfectly, and it is the acme of simplicity and inexpensiveness. Run at a speed of sixteen revolutions per minute, it keeps the contents of the vat agitated perfectly. At high speed such an agitation could be secured as would throw a large proportion of the contents of a vat out over the edges. Its throw is outward from the center, thus overcoming the tendency in other forms of agitators to settle and accumulate a very large mass of considerable thickness at that point.

In treating material by agitation and decantation, the first essential is to get the gold in solution. To determine this is a comparatively easy matter if care is exercised in charging. Thus, to each ton of tailings put in the agitator I would add a ton of solution, having found this amount usually sufficient, although a greater proportion of fluid will be necessary with some very slimy ores, in which case 1½ tons or 2 tons may be used. As assays can be made of the solutions much more quickly than of the ore, check on each vat can be kept while it is agitating. Samples can be taken from the agitator at stated periods, say, every hour, for from one to twenty hours, allowed to settle and the clear solution poured off, filtered and assayed, and the results will tell how long it will be necessary to agitate to secure the best results. If one evaporates his solution, or uses some one of the methods of precipitating, he can take ton for ton or 1½ or 2 assay tons where larger quantities of fluid are used. Greater accuracy can be secured, perhaps, by using larger quantities, and I would not favor taking an arbitrary measure, but a number of assay tons, and dividing the result accordingly. The length of time of agitation will depend on character of material. All that can be obtained in solution with one ore can be secured in an hour; with another twenty hours may be necessary. Generally speaking, few ores will be found where agitation of more than twelve hours will be productive of profitable results.

After agitating for such length of time as is found necessary to dissolve the gold, the vat is filled with solution, that as large a percentage as possible of the fluid contents may be secured when it comes to decantation.

From five to twelve pounds of lime are used to each ton of ore, and this is added when the charge is first put in and before the solution is first brought up to the desired strength in cyanide. The lime not only neutralizes any active acidity, but operates to flocculate or coagulate the material. The lime attaches the lighter particles to the heavier, and, being of greater specific gravity, also carries down some of the slimes themselves. By neglecting the addition of the lime, prior to letting the vat stand for the first decantation, the mass will be less homogeneous, the sands settling first and so compactly that difficulty may be encountered in reagitating the charge. No apprehension of any complication from excessive use of lime need be entertained, as repeated tests have demonstrated that but a limited amount goes into solution, and the constant tendency of the excess is to precipitation, thus clarifying the solution. Experience is the only guide as to amount of lime to be used, crushed ore requiring but a small amount in comparison with the general run of slimy tailings.

Some cyaniders prefer the powdered, air-slacked product for neutralizing the acidity of an ore and would use the same in agitation. Repeated tests have demonstrated, however, that the best results can always be secured with the freshest quicklime. It naturally follows that such should be the case, the chemical action of fresh lime being decidedly more vigorous than such as has lost a portion of its strength by exposure to the air. In the air-slacked material there is an absence of the essential agglutinative element needed to bring about a flocculation or coagulation of the slimes.

In Montana most work by agitation has been on tailings of such a slimy nature as could not be successfully handled by percolation. Such material has not been classified, as in South Africa, and it is a question if it would pay to classify it when 75% of some ores crushed to thirty-mesh will pass an eighty-mesh screen; but, if such were attempted here, the sands could be carried direct from stamps or other crushing power to percolating vats and the slimes to the agitator, thus making a continuous process. Any excess of fluid in the agitator is easily disposed of by decantation before adding the cyanide solution, or dissolved cyanide is added to the charge as it fills the agitator, as the millman prefers. The treatment of ores in this way, judging from my own experience in handling the entire product of a battery with an agitator, is much easier and more satisfactory than the treatment of most tailings, by virtue of the absence of organic matter and other interfering substances. Some of the tailings piles handled have been anything but prepossessing in appearance. At the Schmidt & Johns mill to-day tailings are being treated which are oftentimes one-fourth soil. Part of them are dug up from a meadow which has been under cultivation for over thirty years. Wagon loads of clods, many of them a foot or more in diameter, matted together with grass and other roots, find their way into the agitator, and, except for having to remove the roots after they have separated from the tailings and have risen to the top of the vat, are no trouble to handle. Everything is grist to one of these mills if it only carries the gold.

(To be Continued.)

Tamarack Dividends.

The following table shows the number and amount of dividends paid by the Tamarack Mining Co. of Michigan. That the dividends were very irregular in amount though regular in recurrence is doubtless an indication of varying price of copper and economic conditions at the mine:

1888	$11	1892	$12	1896	$6
1889	16	1893	12	1897	6
1890	13	1894	8	1898	8
1891	16	1895	8	1899	*4

* Semi-annual.

Share capital was 40,000 in 1888, 1889, 1890; 50,000 from 1890 to 1896 and 60,000 since 1896.

Some Experiences of a Working Miner.

NUMBER XIX.

Written for the MINING AND SCIENTIFIC PRESS.

When the W—— mine at C—— was in full blast, I was fortunate enough to visit it. The mine was well managed and was a large affair. The deposit or ore shoot, I suppose you would call it, was about 60 feet wide and the large stopes were timbered with square sets. I cannot recall another instance where such a clean foot wall was exposed as I found in this mine. I have seen polished walls, but usually they are striated and waving, but not so in the W—— mine. This wall was a perfect plane, as smooth and as true as though made to order. It could not have been more regular had it been built by first-class plasterers with scantling, lath, mortar and a coat of dark red kalsomine as a finishing touch. The wall would probably never have been touched had it not become necessary to cut hitches for timber, and this led to the remarkable and very important discovery that the fine foot wall was not a wall at all, for the rock found beyond it looked like that on the upper side of the slip and assay proved it to be fully equal to it in value. The result was that the stope was cut out about 100 feet wide in pay ore instead of 60 as at first. This was not the first nor the last instance in which I have seen an interior plane of fault mistaken for a wall.

* * *

In the early days on R—— creek placer mining was successfully carried on at a number of places, mostly on the bars along the canyon, but these operations were all conducted on a small scale, owing to the limited capital of the individual miners and small companies. After a year or two of fair success, operations ceased on most of the mines. Several years later a number of claims were relocated, some bonded and a few were purchased for small sums and the entire lot was consolidated in one concern known as the B—— B—— G. M. Co. of New York. Money seemed plentiful and some expensive improvements were started. Among other things a dam was constructed on R—— creek and a ditch and flume built to one of the bars owned by the company, and in course of time hydraulic mining was commenced—with what real success none but the manipulators of the enterprise knew, but it was published broadcast that the mines were far richer than they had ever dreamed, and regular monthly dividends commenced. In the summer of 1881 a flood carried out their flume and all mining operations ceased, nor were they resumed for years. The only man about the mines was a watchman who occasionally did a little work on the ditch line to hold the water right. Strange to say, during all these years of idleness the monthly dividends were advertised regularly and glowing reports were published frequently, telling of the progress of work and the splendid outlook for the future. No comment is necessary.

* * *

Few new mines start out under more favorable auspices than did the K—— S—— at T——. It had the backing of almost unlimited money and a high-priced superintendent. A splendid three-compartment shaft was sunk to a depth of 250 feet, fine machinery was installed and a house was built for the superintendent that was a marvel of comfort and even luxury. Stables, shops and stores were on all sides. Without warning, the mine was closed down and the machinery moved away. Inquiry developed the fact that a quarter of a million dollars had been spent, with little to show for the expenditure other than these surface improvements—another clear case of an over-managed mine. The same thing was done at the Q—— M—— mine, though not by the same people. Indeed, the Q—— M—— people fared even worse than the former, for they had expended nearly half a million in gold before they found they had nothing to show for it.

* * *

Conservatism is an excellent thing, particularly when tempted to engage in a new mining enterprise; but even conservatism can be overdone. I went with M—— to examine the C—— mine. It was a good little property, with high-grade shipping ore. Two ore shoots were exposed and one partially stoped; the other cut into, but undeveloped. After a careful examination, and making all necessary allowances, I was satisfied that there was enough in sight to pay for the mine, and, if we got no more ore, we would come out about even. The dump contained a large amount of low-grade ore which could be concentrated and the product shipped at good profit, but this required an additional outlay for machinery and was not included in the estimate. In my report I called attention to a small prospect shaft, only 15 feet deep. It was sunk on a vein 6 inches wide at the surface, which in the bottom of the shaft had widened to more than a foot and the ore was shipping grade. It had a particularly clean come-to-stay look, and I gave it as my opinion that this shoot would prove larger and richer than the other, and strongly recommended the purchase of the mine. In reply to my argument, M—— said I didn't know anything about it and could not see into the ground. I retorted that his judgment was no better than mine

if, after having come so far at such expense, that was the sort of opinion he entertained of my knowledge of mines. "You are sure to get your money back at least," I argued, "and the chance for the future is certainly not unpromising." "Well," replied M——, "what in the world do I want to put so much money in a mine for and be two years getting it back, and the future all uncertain." Argument was useless and we did not buy the mine. Within a month another man took it and began stoping the shoot in sight, at the same time sinking the little prospect shaft. In 50 feet he had opened a vein 5 feet wide, 2 feet of which was high-grade shipping ore, and he got back his money three times over in less than six months. I am sure you will agree with me that this mine was a good buy at the time I recommended its purchase. In my opinion, an investor is always justified in paying all there is in sight if the promise for the future is good.

I had one more experience with M—— which was not less unfortunate. I went to see the G—— mine. There were two claims; the veins were parallel and about 300 feet apart. One was a good-sized irregular vein 2 to 20 feet wide, the ore running from $8 to over $100 and averaging about $30 per ton in gold. The other vein was regular and about 4 feet wide. In it was a pay streak 6 inches to a foot in width and this ore would run $40 to $1500 per ton. The mine had no machinery, unless an arrastra be called machinery. I was more than favorably impressed with the property. The small streak was opened in a dozen places by shallow cuts and shafts all down to water. The big vein had a tunnel 100 feet long on the vein with 80 feet backs at the face. A shaft was sunk to the tunnel and a winze below the tunnel level. The winze was nearly full of water, but the owner assured me there was a very rich streak of limonite mixed with pyrite at the bottom. He had no samples of it, as he had shipped them all away. Considering the general character of the vein, I did not doubt his statement. Indeed, the mine was good enough for me at his price without it. This mine I recommended in the strongest possible way, assuring M—— we could ship ore from the rich streak and pay for the property in a few months. All my argument was vain; he would not touch it because the mine had only shallow working and the ore might pinch out. The ore was not in sight in this mine to pay for it, but this made no difference to me. I was more than satisfied. We did not buy the G—— mine, but another man did a couple of years later, and he did exactly as I had predicted—shipped the high-grade ore from the small vein, recovering the money laid out in first cost—and also paid for hoisting and milling machinery, and since then the mine has produced more than a million dollars. It has not pinched out yet.

MINER.

The Occurrence and Origin of Diamonds in California.*

NUMBER II.—CONCLUDED.

By H. W. TURNER, Washington, D. C.

Lewis does not appear to have visited South Africa himself, and his book is largely taken up with a description of the diamond rock and the fragments of other rocks included in it. According to Lewis the diamonds are crystallized in sharp octahedrons and dodecahedrons. Carbonados and black diamonds are not only found in large crystals but are very common as minute and almost microscopic crystals. The abundance of these crystals is proof that they are not inclosures brought up from some other matrix. Lewis states that only the peridotyte that is full of fragments of shale and other impurities contains the diamonds, which, judging from the description of De Launay, is an error. These shales are highly carbonaceous so that they burn readily. The fragments of shale enclosed in the peridotyte are more compact and have lost their shaly character, their bituminous or carbonaceous matter, and their sulphur. The microscope shows also that they have frequently been mineralogically altered by the heat of the lava and become filled with aggregates of micaceous minerals.

Lewis gives the following minerals as occurring in the peridotyte (kimberlyte): Olivine, enstatite, chrome-diopside, smaragdite, biotite, garnet, perofskite, magnetite, chromite, ilmenite, picotite; and more rarely apatite, epidote, orthite, tremolite, tourmaline, rutile, sphene, leucoxene; also an undetermined mineral, probably cyanite (disthene); and finally diamond. The olivine is often said to be fresh; the biotite is a prominent ingredient. Serpentine, in part bastite, calcite, zeolites, chalcedony, and talc occur as decomposition products. One occurrence of native gold in a Kimberley diamond is on record. This has been reported by Becker. This diamond is now in the Royal Polytechnic High School at Aachen.

Sir William Crookes, who visited South Africa early in 1896, a few months after De Launay, treats of the origin of the diamond more from a physical standpoint, placing great stress on the method of formation of artificial diamonds by M. Moissan, who used iron as a solvent for the carbon. The iron, which must be thoroughly purified, is placed in a carbon crucible together with charcoal made from sugar, and the crucible subjected to a temperature of 4000° C. in an electric furnace. As is well known, iron increases in volume at the moment of passing from the liquid to the solid state. The sudden cooling solidifies the outer layer of iron and holds the inner molten mass in a tight grip. The expansion of the inner liquid on solidifying produces an enormous pressure, and under the stress of this pressure the dissolved carbon separates out in a transparent, dense crystal; in fact, as diamond.

Many circumstances point to the conclusion that the diamond of the chemist and the diamond of the mine are strangely akin as to origin. It has been conclusively proven that the diamond has not been formed *in situ* in the peridotyte breccia. The diamond genesis must have taken place at great depth under enormous pressure. The explosion of large diamonds on coming to the surface shows extreme tension. There were probably many types of crystallization; differing in place and time, or we should not see such distinct characteristics in gems from different mines, nor, indeed, in the diamonds from different parts of the same mine.

The finding of diamonds in meteorites is also utilized by Crookes as further evidence of the origin of diamonds in association with iron. Moreover, iron is the most abundant impurity found in the ash of diamonds after they have been burned. Crookes regards the diamond as having been formed in a laboratory buried at vastly greater depths than we have reached or are likely to reach, where the temperature is conformable with that of the electric furnace, where the pressure is fiercer than in our puny laboratories and the melting point higher, where no oxygen is present, and where masses of carbon-saturated iron have taken centuries, perhaps thousands of years, to cool to the solidifying point.

Crookes regards the peridotyte breccia more as a mud lava than as a true igneous intrusion. While De Launay supposes water vapor to have accompanied the eruption of the peridotyte, he nevertheless regards it as an igneous intrusion, and Lewis likewise appears in the main to take the same ground, although he regards some of the material as a tuff. The specimens of kimberlyte that were shown in the collection of G. F. Kunz at the Chicago Exposition certainly presented all the appearance, both megascopically and in thin section, of a serpentine derived from a peridotyte porphyry, and the description of the rocks by Lewis and De Launay clearly shows that a large portion of it is serpentine derived from an olivinitic lava, and is not of the character of mud lava or tuff. Peridotytes resembling kimberlyte have been found in the United States at Syracuse, N. Y., and Elliott county, Kentucky. So far as known no diamonds, however, have been found in the vicinity of these peridotyte masses. None of the serpentines of California, so far as my information goes, are of the kimberlyte type. The association of the diamonds with serpentine may perhaps be due to the usually higher content of iron in these basic rocks. Diamonds might therefore be expected in any of the more basic igneous rocks.

However, it is by no means certain that diamonds are not formed under very different conditions from those described by Crookes. In a recent paper Derby writes of the occurrence of diamonds in Brazil. Derby states that for the question of genesis the most significant of the Brazilian localities is that of Sao Joao da Chapada near Diamantina. The diamonds occur here in thoroughly decomposed material, no absolutely fresh rock being found. So far as can be made out from observations on material the most unsatisfactory that can be imagined, the most plausible hypothesis as regards the various clays of Sao Joao da Chapada is that they represent a group of phyllytes of varied character but principally if not exclusively of clastic origin threaded with dykes of pegmatyte. The clastic origin of the schists is regarded probable from the worn character of the zircons found in the clay derived from the schists. The diamond-bearing streaks appeared to Derby to contain distinct bands composed in part of quartz, with plates of specular iron, and these bands he suggests may be pegmatyte dykes. The primary tourmaline and zircon and the secondary hematite and rutile found in the heavy residue after washing the clay are supposed to have originated in the pegmatyte, the hematite, anatase and rutile having formed from original iron and titanium minerals now gone. The staurolite and disthene found in the heavy residue are supposed to have come from the schists where they may have formed as a result of contact metamorphism induced by the intrusive pegmatyte. Derby is inclined to think that the diamonds have come from the schists along the borders of the pegmatyte dikes and not from the dikes themselves. In other words, he appears to regard it possible that the diamond is a product of contact metamorphism. Moreover, he states that no rocks of the peridotyte series have been found in direct association with the diamond-bearing beds at any point in Brazil. He lays some stress on the occurrence of tourmaline and disthene in fragments of schist in the South African peridotyte breccia. Disthene is characteristic of schists, and tourmaline often so; and, as De Launay states that there are schists mingled with the lower quartzites in the mines of South Africa from which the schist fragments in the breccia were probably derived, Derby suggests a possible analogy between the South African deposits and those of Brazil. He considers that in order to bring the Kimberley and Brazilian modes of occurrence into line as facies of a single mode of genesis, it seems necessary to put aside the idea that the recent interesting experiments on the artificial production of the diamond afford a solution of its terrestrial origin and also that the Kimberley type of rock and mode of occurrence are essential features. Derby would thus suggest the origin of the South African diamonds in the underlying schists as a result of igneous intrusions, a very unlikely hypothesis in light of the investigations of Lewis, De Launay, Crookes, Moissan and others indicating the deep-seated origin in molten material. It is regarded as certain by Derby that the Brazilian diamond must have had a different origin from that now ascribed to the South African occurrences.

Some Characteristic Mines of the California Gold Belt.

Written for the MINING AND SCIENTIFIC PRESS.

Among the mines of the gold belt which have recently come into prominence is the Shawmut-Eagle mine, near Jacksonville, in Tuolumne county. One of the most striking features of the landscape is the massive croppings of white quartz on the vein in these mines. They rise above the tree tops and are visible for a long distance. The ankerite zone is broad here also, but not so wide as at Coulterville and Pinon Blanco.

The foot wall is serpentine, back of which lies a broad belt of black slate of the mariposa beds. On the hanging wall appears a large dyke-like mass containing auriferous iron sulphide. This material has a semi-slaty structure, due to pressure and movement, which is pronounced in this section. Heavy gouges of a serpentinous character are common. A granitic dyke lies along the east side of the lode for a mile or more in this part of the county. Its texture is variable, from felsite to a granular rock of granitic habit, in which the mica occurs sparingly; muscovite syenite and mica diorite also occur. Farther northward slate lies on the hanging wall of the lode, and diorite forms the foot wall, with serpentine distributed irregularly.

On the low eminence known as Poverty hill the Mazeppa, Jumper, New Era and Golden Rule form a group of mines, though not under one ownership or management. Their geological characteristics are similar in essential particulars. A crosscut tunnel in the Golden Rule mine from the west side of the hill through the foot wall country gives an excellent exposure of the relations of the various rocks.

The tunnel is started in a granular diorite and passes from it into serpentine, which here is 100 feet in width. Beyond it lies a broad zone of ankerite containing mariposite and separated from the serpentine by a heavy gouge. A dyke of diorite, similar to that in the west country, divides the dolomitic zone into two separate masses. In the ankerite occur irregularly large lenses of massive quartz, mostly on or near the hanging wall side.

East of the ankerite zone is a succession of diorite and diabase dykes, which are locally altered in part to amphibolite schist. Along one of these schistose zones appears a dyke of rock resembling diabase, but rather lighter in color and inclining to gray. This dyke is often found to contain a reticulated mass of quartz veinlets, and is frequently rich in gold. The chlorite schist, 2 to 10 feet in width, is also seamed with veinlets of quartz and calcite, in which gold is found in very rich streaks. Auriferous pyrite is distributed throughout the zone of chlorite schist. Narrow veins of quartz and calcite lie between the dyke and the schist, and these, too, are gold-bearing.

Gold-bearing zones also occur in schist near the mass of diorite, dividing the ankerite zone. For a distance of 1000 feet east of the ankerite vein the hanging wall country is amphibolite schist, in which appear numerous small dykes, striking with the inclosing rocks. Small, nodular lenses of quartz, and quartz seams are abundant. Many years ago the surface of this formation was sluiced by placer miners to bedrock, the soil being shallow, and much gold obtained. Elsewhere along the gold belt these hanging wall schists have been found to contain large auriferous zones and have been worked with profit, and it is quite reasonable to expect to find pay rock in this instance as well, but no systematic search for it has been made for it as far as the writer is aware.

The most irregular of the rocks appearing along this portion of the gold belt is the serpentine. First it appears on one side and then on the other of the main lode, and again it is entirely absent. At one time it was thought that the appearance of serpentine had a marked influence on the mariposite, but it does not appear that this is so, for mariposite is found where no serpentine is seen, and where serpentine is abundant in some places mariposite is wholly absent.

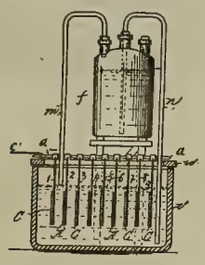
Latest Mining and Metallurgical Patents.

Patents Issued May 30, 1899.

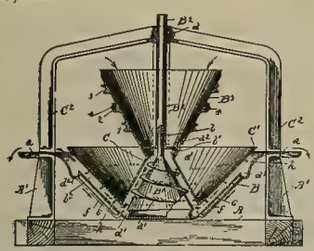
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

PROCESS OF OBTAINING CHEMICALLY PURE GOLD.—No. 625,863; Emil Wohlwill, Hamburg, Germany.



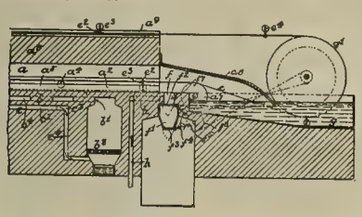
A process which consists in passing an electric current from an anode of impure gold or of an auriferous alloy through a gold chloride solution, to a suitable cathode, and maintaining in solution at all times during the passage of current hydrochloric acid in sufficient quantity to prevent the liberation of gaseous chlorine at the anode; also in passing a current of high density (500 amperes per square meter or higher) from an anode of impure gold or of an auriferous alloy through a gold chloride solution to a suitable cathode.

AMALGAMATOR.—No. 625,909; E. J. Verrue, San Francisco, Cal.



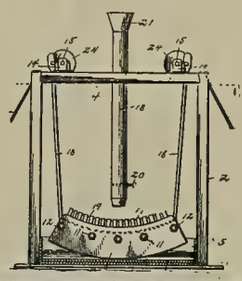
An amalgamator, the combination with the stationary amalgam pan, of the central cone-shaped worm-threaded hub upwardly projecting therefrom, the rotatable shell fitted within pan so as to form an annular passageway which holds an amalgamating bath, an inclined central wall in shell which fits over the cone-shaped hub of the pan, a drive hopper attached to the central wall of the shell, and a central supporting shaft connected to the wall of the hopper; the amalgamator having combination with the stationary dish-shaped amalam pan, of the central cone-shaped worm-threaded hub upwardly projecting therefrom, a series of pockets formed in the pan near its upper edge, a pipe connection between pockets and the bottom of the pan, a rotatable shell provided with an inclined central wall fitted within the amalgam pan so as to leave an annular passageway between the shell and the inclined wall and cone-shaped hub, a series of shelves or ledges projecting from the outer wall of the shell, and a drive hopper attached to the inclined inner wall of the shell, and a central supporting shaft connected to the hopper. The combination with the stationary amalgam pan, of a series of pockets formed therein near its upper edge, a pipe connection between pockets and the bottom of the pan, a rotatable inner shell fitted within the pan so as to form an annular passageway which holds an amalgamating bath, a series of shelves or ledges projecting from the outer wall of the shell, a feed supply for the material, and of devices for forcing the material into and through the bath contained in the annular passageway.

FURNACE FOR TREATING ORES.—No. 625,912; A. G. Wells, London, England.



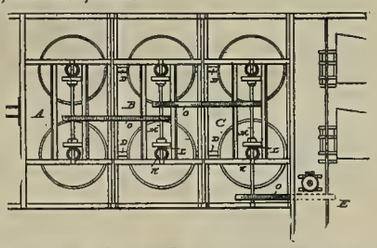
Apparatus for roasting ores, in combination, a closed roasting chamber wherein ores are roasted and reduced, a fire chamber, means for supplying reducing gases to closed chamber and leading them there from, the roasting chamber hearth, the transversely arranged zigzag heating flues below the bottom of closed roasting chamber serving to lead furnace gases from fire chamber to and fro under roasting chamber hearth, and air heating flues below heating flues serving to lead atmospheric air from an inlet at the cooler end of apparatus to fire chamber whereby it is heated, the fire chamber being arranged adjacent to the ore outlet end of the apparatus. A hopper with a flap bottom for supplying ore to be treated to chamber, hopper with superposed flap bottoms for removing treated ore and preventing access of air to chamber, means for supplying reducing gases to chamber and leading them therefrom, a water tank at each end of the chamber, and a hood at each such end dipping into the water tank and serving to seal and close the chamber end, and means for traversing the ore from end to end of the chamber adapted to emerge from and to re-enter chamber through water tanks and to be cooled thereby before re-entering the chamber, and to actuate both the ore inlet and the ore outlet hopper flaps, at regular intervals; apparatus for roasting ores in a closed or air-tight chamber, the combination of a chamber wherein the ores are roasted and reduced, means for admitting ore to the chamber, an exit for treated ore, a gas outlet communicating with chamber, tanks g, g, at opposite ends of the chamber and adapted to hold liquid, means for closing the ends of the chamber except through liquid in tanks, wheels g', g', axles therefor, wheels extending into the tanks below liquid level employed therein, endless chains passing around wheels g', one side of the endless chains passing through the chamber, the other side of the chain passing outside of the chamber, and means moved by chains for moving ore longitudinally through the chamber.

QUARTZ MILL.—No. 626,079; Norman McAulay, Hill City, S. D.,



A quartz mill, rocker plates connected in pairs, in combination with the interposed ridged or corrugated apron connected to and rocking with said plates for distributing material, the pans in which rocker plates operate underlying the discharge sides of the apron; rocker plates being connected by tie rods, of the longitudinally ridged and transversely corrugated apron overlying rods connected with rocker plates, to rock with them; the pans in which plates operate provided with removable wear plates and side openings with gates through which contents of the pan may be discharged, oppositely disposed cranks connected with the opposite ends of rocker plates for actuating them, the ridged and corrugated apron intermediate rocker plates, discharging laterally and upon opposite sides into pans, the feed chute for supplying the material thereto provided with means for controlling feed, and means for imparting a rotary notion to crank shafts actuating rocker plates.

APPARATUS FOR TREATING ORES.—No. 626,173; F. Leech, Boulder, Colo.



Combination of a series of arrastras arranged in sets after the manner of steps, conduits leading from the top of one set of arrastras to the next set below, and grinding mechanism arranged in the arrastras whereby the pressure upon the large fragments will force the finer particles to raise and pass through the overflow conduits to the next set of arrastras below and receive further reduction, each arrastra consisting of open horizontally disposed receptacle, a radial arm or support carried by a vertical shaft, and vertically yielding or adjustable drag stone or drag appliance, so that each succeeding arrastra will be adjusting itself to and operating upon more and more finely reduced material.

PRODUCTION OF CHEMICALLY PURE GOLD BY ELECTROLYSIS.—No. 625,864; Emil Wohlwill, Hamburg, Germany.

A process of obtaining pure gold, which consists in passing an electric current from an anode of impure gold or of an auriferous alloy to a suitable cathode through a gold chloride solution and maintaining in solution at all times during the passage of such current another chlorine compound in such quantity as to prevent the liberation of gaseous chlorine at the anode and so as not to dissolve the silver that may be contained in anode.

The Eight-Hour Law in Colorado.

TO THE EDITOR:—Colorado's eight-hour law goes into effect on June 15th, and while there is some friction incident to the adjustment of shifts and wages to meet the new condition, it is apparent that there is a disposition on the part of both employe and employer to make such reasonable concessions as will obviate a contest. The State never had before her a season of greater activity and more substantial prosperity than is now presented. But thinking men of every rank realize that it could all be shattered in a day by precipitating a clash between organized labor and organized capital. While there has been no little apprehension felt over the State for the past month, at this writing there is a clearer atmosphere, with a strong probability that any serious difficulty will be averted.

In many of the larger mines the eight-hour shift already prevails, and in such cases no changes will be required. In those mines where nine and ten hours constitute a day's work, there seems an almost general intention on the part of the owners to adopt the eight-hour day and pay the same wages for eight-hour shifts as are now being paid for nine and ten hours. It is conceded that in such cases full eight hours' work will be insisted upon and freely given, and it is generally believed the result will be the accomplishment of as much as under the former system. A few mines are heard from where it is announced that their miners are to be paid by the hour at such figures as will result in a reduction of wages, differences arising from which seem in a fair way to be settled.

The smelting plants belonging to the American Smelting & Refining Co. at Denver, Pueblo, Leadville and Durango have announced a plan of paying their employes by the hour, requiring no person to work longer than eight hours in twenty-four, but giving all the privilege of putting in extra time—this being optional with the workmen. Following this comes another announcement of a general advance in wages to all employes of about 10%, to be in effect from June 1st. It is claimed this advance practically restores the wages in vogue prior to '93. In Denver the furnace men will get 24½ cents per hour, side men and charge wheelers 20½ cents, common laborers 17½ cents. In Leadville the scale of wages is higher, by reason of living expenses being higher than those in Denver. When the pay by the hour system was announced at Durango the force there declined to continue at work and the smelter at that point closed down, but that was prior to the promulgation of the 10% advance in wages. The differences there are still unsettled at this date.

Denver, Colo., June 3rd, '99. WASCOTT.

Nickel and Cobalt.

Many of the old sources of the world's nickel supply are practically exhausted. A certain amount of ore is still obtained from Norway and Hungary. South Africa supplies an arsenide containing 25% cobalt, but only in small quantities. South America was formerly a great source of nickel and cobalt, some of its hydrated arsenites testing 25% in the ores of nickel, and 17% in the ores of cobalt. A. F. Johnstone, who is a very good authority on the subject, says that the only mine in Connecticut has been worked for many years, while Sweden has yielded nickel from the Klefra and other mines. In Germany the supply of nickel is obtained principally from the Mansfield mines. The rich nickel deposits of New Caledonia now furnish a large proportion of the supply, and important shipments of the ore are going forward to Europe. This ore is a double silicate of nickel and magnesia, the percentage of nickel ranging from 7 to 10. Nevada, however, is the latest source of supply, both of nickel and cobalt. In '80 a powerful impetus was given to the utilization of nickel for manufacturing purposes, by the invention of Wiggin & Co., Birmingham, for rendering the metal malleable by the use of manganese. A year later a German inventor, Dr. Fleitman, accomplished the same result by the use of magnesium. Thus produced nickel may be drawn into wire or rolled into plates, and be stamped, beaten, raised, or welded. The adoption of nickel for coinage purposes by Germany in '73, raised the price of the material from 4s to 16s per pound, but this inflation was only temporary, and the average price to-day is about 2s per pound. The oxide of the metal is used in the Staffordshire potteries for giving a soft brown tint to china and earthenware. Cobalt is used chiefly as an anode in plating, and for some parts of scientific instruments. It does not whiten copper to the same extent as nickel. The oxides of copper are of very great value in the coloring of china, earthenware and glass, and form the basis of the pigment known as cobalt-blue. The present-day tendency is to replace brass and electroplate by white alloys which have nickel for their basis. These alloys are known by such names as "silveroid," "argentoid," "navoline," "nickeline," etc., but they are all varieties of German silver, mixed either with tin, lead, or cadmium, according to the requirements of the metal. Nickel and cobalt ores are very largely smelted in and around Birmingham.

When is an Undertaking Feasible?

It is an old adage that "Nothing risk, nothing gain." This maxim might well be read, "With no great risk there is no great gain." But the "risk" is a relative matter and not an absolute one. That which in the hands of one person would inevitably fail, may, in the hands of another, be successful. Not infrequently an enterprise which from one view-point has already failed has, in fact, merely reached the first tollgate on the highway to success. In a paper read a short time ago before the American Association of Inventors and Manufacturers, F. A. Richards, apropos of this, made the point that the probability of success is measured by the environment and the resources available. One person, examining a certain enterprise and finding the risk of too hazardous a nature to warrant his attention, may very properly decide the enterprise to be impracticable, or, as to himself, impossible of accomplishment. This decision under the circumstances does not in the least indicate that, from the standpoint and experience of some one else, the same enterprise cannot be safely undertaken and effectually carried on to a successful conclusion. The real question, therefore, is not so much whether a risk exists, but what relation the existing risks and uncertainties bear to the ways and means that are available for overcoming them.

This principle is well illustrated by many of those newer institutions which are classed among the "necessaries" of modern life. Consider, for instance, the many facilities which are now accomplished facts but which not so very long ago, as history is measured, could not have been produced by any one anywhere in the world. The electrical propulsion of cars, for instance, is an accomplished fact of almost immeasurable practical importance, and yet only a century ago such an achievement was not only undreamed of, but was literally impossible of accomplishment under the conditions then existing. The same is true of the steamship, the modern locomotive, the ice-making machine, the reaper, the telegraph and ocean cable, the telephone, the newspaper, the modern postal system, and many other instrumentalities which come to be considered necessary not only to the progress, but even to the sustenance of the race. The times and circumstances, therefore, rather than the risks and the difficulties involved, determine, broadly speaking, the feasibility at any given time and place of every undertaking which is "possible" within the limits of natural laws.—Cassier's Magazine for June.

Aluminum Feed Wires.

The Pittsburg Reduction Company has received an order from the Chicago Northwestern Elevated Railway Company for 150,000 pounds of aluminum to be used as feed wires on that road. This will be the first electric road in the country that has attempted the use of aluminum for feed wires.

Three sizes of aluminum cable will be used. The largest feeder is about 1½ inches in diameter, and the railroad company is buying over ten miles each of the two larger sizes. The feeders will be placed in a wooden box or trough, covered by the board walk between the tracks of the elevated. They will be supported on vitrified clay blocks, about 9 feet apart and designed with an umbrella drip. Every 100 feet a special malleable iron chair will be used, the cable being carried in split spool insulators to carry the slack. Experiments have been made by J. R. Chapman, chief engineer of the Northwestern.

It is estimated that forty-seven pounds of aluminum wire will answer the same purposes of a hundred pounds of copper wire, while the difference in cost, considering the equal conductivity, will make the aluminum cheaper. The copper costs about 20 cents a pound, while the aluminum can be had for about 36 cents a pound. The installation in Chicago was caused by the rising price of copper and the success of the aluminum lines at Niagara Falls and at Snoqualmie Falls on the Pacific coast. — American Manufacturer.

A New Building Material in Germany.

Consul Warner writes from Leipzig that under the name of "keramo," a building material, composed principally of glass and manufactured at Penzig, Silesia, has been placed on the market. As far as known, this material is made from powdered glass waste, which is hardened by a special devitrifying process and combined by means of strong pressure. In this way the transparency, brittleness and fragility of the glass are destroyed, but other prominent properties — extraordinary hardness, stability against exposure to the weather, non-conduction of heat, non-inflammability, insensibility to oil, grease, acids, etc.—are retained in this new material.

Keramo can be used with good results for wainscottings in the interior of buildings, for covering floors in houses, kitchens, washing rooms, verandas, balconies, etc., for rough casting of walls exposed to the weather, as well as for staircases which are to be fireproof. The color depends upon the color of the glass used in the manufacture. The price of keramo is about $1.60 per square yard, and so far the trials which have been made with this product have been most successful.

SIGNS are that there will be no summer shutdown in the iron and steel mills this year. Manufacturers are far behind in their orders and a closedown would mean the loss of trade. Therefore, contrary to the usual routine of wage settlements in the iron, steel and tinplate industries, conferences on the new lists will be held in Detroit immediately following the adjournment of the national convention of the Amalgamated Association on May 30. The manufacturers want to abolish the usual suspension, which is inaugurated on June 1, the time the Amalgamated sliding wage scales expire, and continue until the new rates are agreed upon, which is generally a month later.

WOOD crackles when it is ignited because the air expanded by heat forces its way through the pores of the wood with a cracking noise. Green wood makes less snapping than dry, because the pores contain less air, being filled with sap and moisture which extinguish the flame, whereas the pores of dry wood are filled with air which supports combustion.

Industrial Notes.

—The United States M. Co.'s works at Bingham, Utah, are to be equipped with a full electric plant this summer.

—A contract for 10,000 tons of 65-pound steel rails has been let to the Colorado Fuel & Iron Co. by the Pacific & Idaho Northern R. R. Co., which is now building into the Seven Devils copper region from Weiser, Idaho. The road is to be 100 miles in length.

—The south mills of the Illinois Steel Co. at South Chicago, it is claimed, has broken the world's record of steel rail making in a twelve hours' run, turning out 1310 tons of rails. The former record of 1301 tons was also held by the South Chicago plant.

—Satisfactory experiments made with compressed air in anthracite coal mines has induced the Philadelphia & Reading Coal & Iron Co. to use cars operated by compressed air in some of the mines, with the intention of a general substitution later on. The Shenandoah district will be equipped first.

Commercial Paragraphs.

FLINT & LOMAX, electricians of Denver, Colo., report a busy season in electrical work.

NOCK & GARSIDE, machinists of Denver, Colo., occupy new quarters at 1650 Wazee street.

THE Colorado Iron Works' city office is now 721 Seventeenth street, Denver, where they have larger and finer quarters.

THE American Steel & Wire Co., headquarters in Chicago, is represented in Denver, Colo., by O. B. Barrows, 1627 Blake street,

WHEELER, FRANTZ & MCRAY have opened a shop at 1516 Eighteenth street, Denver, Colo., where they are equipped to build gasoline engines.

Personal.

E. M. SPARHAWK represents the Carnegie Steel Co. in Denver, Colo.

W. A. FARRISH of Denver has gone to Boise Basin, Idaho, to examine mining properties.

THE Siemens & Halske Electric Co. of Chicago is represented in Denver, Colo., by A. L. Searles.

C. M. FASSETT, assayer and mining engineer of Spokane, Wash., was in Denver on the 5th inst.

C. D. LANE, Woodson Garrard and Dr. Spalding of Angels, Cal., leave for Alaska on the 10th inst.

JAS. A. MCCLURG recently returned to Denver from Los Angeles and points in Lower California.

C. W. VAN LAW of Denver has a position with the New England Exploration Co. at Telluride, Colo., as millwright.

ROSS E BROWNE has returned to San Francisco, Cal., after an absence of several weeks in Mexico and later in London, Eng.

D. W. THAYER, one of the owners of the Japan mine near Telluride, Colo., recently returned to Denver from Los Angeles, Cal.

CAPT. THOS. MEIN, who was reported very ill at Seattle a few days since, is much improved and has returned to San Francisco, Cal.

W. G. SCOTT, who for several months past has been Supt. of the Mt. Shasta Gold Mines, Ltd., has resigned, being succeeded by O. G. Rogers.

W. C. RALSTON, Vice-Pres. California Miners' Association, left San Francisco on the 5th inst. for a visit in the East. He will return in three weeks.

F. F. COFFIN has resigned the superintendency of the Griffin mine in El Dorado Co., Cal., near Diamond Springs, being succeeded by James Richards.

J. T. O'BRIEN, foreman at the Griffin mine near Shingle Springs, Cal., has gone to the Jumper mine near Stent, Tuolumne Co., Cal., to take charge of that mine.

W. B. MURDOCH of San Francisco has returned from a trip through western Nevada, where he has been investigating copper properties in which he is interested.

THE Grass Valley Exploration Co. has appointed Mark B Kerr general superintendent of its mines and works, and H. Pengelly superintendent of the W. Y. O. D. mine.

FRED HOWE BOSTWICK of the Hendrie & Boltboff Mfg. & Supply Co., Denver, Colo., is out for a trip through Idaho, Montana, British Columbia, Washington, Oregon and California.

S. W. TRAYLOR and Smith McKay, representing the Colorado Iron Works, are in San Francisco, Cal. They have been making an extended trip through California mining regions and visiting pleasure resorts.

JOHN D. ROCKEFELLER of New York is in California visiting the Yosemite valley and other places of interest. While in the State Mr. Rockefeller has been investigating the oil fields on the western side of the upper San Joaquin valley.

E. H. BENJAMIN, secretary of the California Miners' Association, left San Francisco, Cal., Wednesday, the 7th inst., for Sierra county, Cal., accompanied by Prof. A. G. Lawson and H. Hirst of the University of California at Berkeley. They go to make an extended examination of the Gibsonville and La Porte divide, to determine the extent of the gravel channel system of that section in the interest of the Feather Fork Gold Gravel Co., also known as the Thistle Shaft Co.

THE Executive Committee of the California Miners' Association in charge of arrangements for entertainment of the American Institute of Mining Engineers are making good progress with the work on hand. The personnel of this committee, which was appointed by President J. H. Neff, is as follows: W. C. Ralston, S. B. Christie, C. H. Lindley, W. S. Keyes, J. F. Halloran, E. H. Benjamin, Capt. T. Mein, C. G. Yale, A. A. Watkins, E. A. Belcher, H. T. Power, W. B. Bourne, A. D Foote, G. Starr, F. Zeitler, B. S. Rector, W. S. Hammon, W. F. Detert, F. F. Thomas, D. R. Oliver, M. B. Kerr, T. Hender, F. Wilmans, P. A. Buell, W. H McClintock, F. A. Leach, C. C. Derby, J. J. Crawford, H. E. Picket, P. G. Gow and L. E. Aubury. As a Committee on Reception President Neff appointed H. T. Gage, T. L. Ford, J. D. Phelan, D M. Burns, J. M. Scott, A. J. Ralston, W. W. Montague, R. S Moore, J. Spiers, Jr., B. T. Lacy, T Henshaw, S. J. Hendy, H. T. Lally, S. Mooney, G. H. Wallace, A. Carrigan, J. Sloss, J. M. Wright, J. F. Davis, J. Bermingham, J. Sonntag, E. Coleman, W. A. Doble and J. S. Brownell.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TYPEWRITER DESK.—Henry B. Sanders, Willows, Cal. No. 625,852. Dated May 30, 1899. This invention relates to a desk which is adapted to be used in conjunction with typewriting machines. The desk has a two-part surface, one of said surfaces being permanent and the other so mounted as to stand in the plane with the permanent portion when closed and thus form a complete desk top. This portion has connections by which it may be depressed and thrown forward into line with the typewriting machine which is normally contained within the back part of the desk. When the top has been thus depressed, the front of the back portion and an extension connected therewith serve as a track upon which the machine may be drawn forward into position for use. When the machine has been pushed back into the receptacle, the desk top is raised and a front and sliding top piece which are connected therewith are simultaneously moved into position to close up the whole of this part of the desk so that it corresponds with the other half.

VACUUM TANK AND WATER LIFTER.—L. L. Gross, Petaluma, Cal. No. 625,882. Dated May 30, 1899. This invention relates to an apparatus for filling tanks with water or other liquid, or semi-liquid, and a means for producing a vacuum within the tank. The tank has inlet and outlet openings and controlling valves or cocks, a chamber adapted to contain carbide of calcium, having a sleeve at the lower end, a charge-measuring chamber upon which the sleeve of the carbide chamber is turnable, with means for submerging the charge in the tank so as to produce a gas. The gas, rising, fills the tank, and by means of an igniting device, the gas is exploded and a subsequent vacuum is produced, which causes the liquid to be drawn into the tank.

SPOON AND LEADER BOX.—E. A. Moeker, San Francisco. No. 625,893. Dated May 30, 1899. This invention relates to a box which is especially designed for the use of fishermen, and to carry spoons, leaders and other parts. The box is constructed with an open-top hinged cover, a horizontal partition intermediate between the top and bottom and parallel therewith, and an absorbent material between which the leaders may be carried. Vertical partitions extend from the lower part of this horizontal partition to the bottom of the box, forming compartments which are adapted to contain spoons and like articles. Openings in the ends and side with suitable doors serve to give access to these various compartments.

BURGLAR ALARM.—W. P. Murphy, Willowglen, Cal. No. 625,080. Dated May 30, 1899. This invention is designed to protect doors, windows and like openings from being tampered with by burglars and others, by producing an explosion or sounding an alarm which will awaken the occupants whenever the window is disturbed. It consists of a spring-pressed pivoted hammer, a cartridge holder in line with the head of the hammer, a spring-pressed lever fulcrumed upon the second sash and normally engaging the hammer so that the hammer is raised whenever either part of the sash is moved. When the lever has drawn the hammer back, the continued movement of the sash will release the hammer from the lever and allow it to fall upon the cartridge, which will thus be exploded.

MASSAGE MACHINE.—W. W. M. Hickey, San Francisco. No. 625,976. Dated May 30, 1899. This invention relates to an apparatus which is designed for the massage treatment of persons. It consists of a standard having parallel counterbalanced arms pivoted to the upper part, a curved yoke connected with the opposite ends of the arms, with bars and rubbers attached thereto and carried by the yoke, an intermediate mechanism by which the bars and rubbers are reciprocated, and a means for turning the standard consisting of semi-globular footpiece, a correspondingly-shaped base and socket within which the footpiece is turnable, said footpiece having holes made around it, and a spring-pressed foot pawl with point adapted to engage the holes so that the standard may be turned and the parts carried by it, moved horizontally around the circle.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING MAY 30, 1899

625,917.—FLEXIBLE SUPPORT—W. S. Arnold, S. F.
625,920.—LAWN SPRINKLER—W. Ballerstedt, Los Angeles Cal.
626,145.—BICYCLE GUARD—B. C. Crane, Montesano, Wash.
626,003.—SHEATHING—O. R. Dahl, Seattle, Wash.
626,159.—SHIP'S VENTILATOR—G. M. Eaton, S. F.
626,153.—INSECTICIDE—E. F. Eichholtz, Conway, Wash.

625,989.—PADLOCK—J. A. L. Snyder, Somis, Cal.
625,813.—FOLDING SCAFFOLD—W. C. Stull, New Whatcom, Wash
625,909.—AMALGAMATOR—E J. Verrue, S. F.

Recent Mining Incorporations.

Kings River Oil Co., Bakersfield, Cal; capital stock, $100,000—subscribed; J M. Elwood, G. Wiseman, J. Elwood, B. Elwood, J. C. Marlar.

Wild Goose M & T. Co., San Francisco; capital stock, $1,000,000; subscribed, $50; C. D. Lane, E. J. McCutchen, J. D. Arnold, H. C. Stevenson, A. H. Winn.

Great California Co., San Diego, Cal., to buy, sell and develop gold mines; capital stock, $3,000,000—paid; C. H. Atkins, N. Alexander, W. Llewelyn, A. C. Meyer, G. N. Atkins, G. W. Ingils, W. L. Rose.

The MacArthur - Forrest Cyanide Process.

TO THE EDITOR:—Having been the first to introduce the cyanide process to the public of California and Nevada, through the columns of the MINING AND SCIENTIFIC PRESS, and having been out of the literary field respecting it for some five years, a little explanation may be in order, as some have argued from my silence that my earlier expressed views of the great value of the process to the mining world had changed, but this is not the case. From practical operations when I first spoke I knew what I was talking about, and here I might as well say my silence was caused mainly by a difference of views as to royalty, which was then set at $1 per ton. This I regarded as unjust to the miner, as I was not going to lend my pen for the furthering of the interest of any company placing such a tax on the mining public. This royalty is now changed in all the mining States, and much to the benefit of the miner and, as I consider, also for the company holding the United States patents.

In an article published in the MINING AND SCIENTIFIC PRESS in 1891, answering some criticisms deriding the process, I said regarding it: "Those opposed may fight and wear themselves out; the process has come to stay and will swim above all denunciations of it." Well, it is staying all over the mining world, as the millions of dollars it produces yearly clearly prove. That the MacArthur-Forrest process is a most valuable boon for the mining public rests in its great simplicity, efficiency and cheapness of manipulation, for by it the highest per cent can be obtained at less cost per ton than any other system for extracting gold yet known, and, I must say, where ores are suitable for it, and most of our gold ores are. When working gold the getting of all of the value is simply a question of profit and loss, time being one of the main factors. What can be better than this?

As backing for the above assertion, I will quote from an address of Dr. Loevy, president of the South African Chemical and Metallurgical Society, who said: "Speaking on the essential possible improvements of the cyanide process, I unhesitatingly give it as my opinion that we have arrived at the top, as far as the chemical part of the process goes—this regarding the solution of gold by cyanide."

Here I will say it must be remembered that the great majority of mills working in South Africa are using the MacArthur-Forrest process. From the time of my first knowledge of it I have been a great believer in its value, and in consequence during the intervening years have kept a watchful eye on its progress and all the presumed "improvements," which, as I see and analyze them, are wandering away from the simple, economical and efficient plan of its first conception, and this without adding a compensating per cent in return, as in about every instance there is an extra expense involved. In this connection I will say that I have read about all the cyanide literature put forth, and find more or less of the material invariably too scientific for the practical operating miner to be interested in or to study out. Some writers are so intensely scientific that they lose sight of the practical side, while others are so practical they pass over all formulæ as Greek, the mode of work being all that is desired, and with it the question of profit and loss; and it is this practical feature of the system I have kept uppermost and in all correspondence want to make clear.

When it comes to working the process it is simplicity itself; and yet it requires practical and intelligent knowledge of its several important features, all of which a man of sense and experience can soon acquire. I am not now speaking in a scientific sense, but a purely practical, money-making sense. Respecting the process, it is grandly scientific and as grandly practical, and that it is one of the important metallurgical inventions of the age the millions of dollars it has put into circulation proves, and the sooner the miners of California take to it the better it will be for the State and for themselves.

I say California, for the reason that of all the mining States here are the ores most suitable, carrying, as they do, less bases; and again because California is further behind in the introduction of this advanced system than any of the mining States.

As to the great value of the system, we have only to recall the early failures of South Africa, and after the introduction of this process its great and growing prosperity. Last year in the Transvaal the yield by cyanide alone exceeded $9,000,000, being more than half of the entire gold yield of California.

Thus it will be seen that the process has done a great deal for South Africa—and I must say South Africa has done a great deal for the process, as they no sooner started in to work than they grasped the importance of the system, and in a remarkably short space of time hundreds of thousands of dollars were rushed into plants for the mills, and to-day they are working on the most thorough and extensive scale, some having tanks of 500 tons capacity to the charge. By this California can comprehend how far she is behind, while we think we are very progressive.

Not only has the process benefited South Africa, but Australia, New Zealand and, I may say, some of the several mining States of our own country. The Mercur of Utah was a failure until it operated the MacArthur-Forrest process, and since its introduction the Mercur has paid $1,266,000 in dividends. What has been done in South Africa and elsewhere can be done in California—and I think better in California, as a whole, than elsewhere, our gold ores being certainly cleaner than any of the gold-producing States. And I must add that one of the remarkable features of this discovery is that the very class of gold which up to the time of the introduction of the MacArthur-Forrest process had baffled the chemical and mechanical skill of the world now takes first rank as being the easiest saved when worked by it.

No one can appreciate the system more than myself, as for more than thirty years before its introduction I experimented extensively for the better saving of gold, and wrote much on the wastage of the precious metals. My system of dry amalgamation was a good advance, as respects per cent, but when the question of comfort and expense of operation was concerned I dropped my own pet and accepted the MacArthur-Forrest as more economical in operation. So much for the process. The next important feature to know is the proper erection of a cyanide plant. This depends more or less on the locality, yet all is simple and within the scope of any fair mechanical head who will carry order in his work and knows what he is constructing through suitable drafts.

When it comes to handling a plant after erection there are only two very essential skilled men required. One is the man who knows the rationale of the process in all its bearings, and the other is the assayer; and you do not want to be too economical in this department. You want to know where you are in your work all the time. First, you want to know the value of your ore, and then, as you go along, at every stage. This means careful attention and steady work, but it pays and pays well. It is this careful attention to assaying—the knowing what you are doing—that our mill men have ever been too neglectful of, they too often estimating the value of their ore by what they saved, and in the majority of instances run off fully 40% of the value, and for twenty-five years ran off all of 60%; and I may say even now the majority do not take the pains they should to find out what they lose, they being satisfied by saying "they get about 75%." But saying so does not make it so.

In building or working mills for the cyanide treatment there is no need of making failures if the proper precaution is taken. No one should start in without a thorough test of the ore he contemplates working. It is better to expend $25, $50, or even $100, if needs be, before building a plant, than make a loss of $1000 or more afterwards.

Failures do no one any good, and the greatest care should be taken to know all and be sure you are right, when right is so easily obtainable. I built a 10-ton mill on a 12-pound test, and had better per cents in the mill than the tests gave. I would not be afraid to build a 100-ton plant on a proper test of 100 pounds.

My object is to give the general mill man an idea of the simplicity of the process, that he need not consider he has to go through a course of chemistry, as he is likely to think, when he starts out to read up the process in the several excellent works published, and that he need not have any fears of getting into the insane asylum before he can fully comprehend it. As before stated, what can be done in South Africa, Utah and elsewhere can be done in California, if our mining men will wake up to the possibilities about them. California ought to be producing $40,000,000 per annum, when we consider the vast mineral field she possesses and the great strides that have been made in the last ten years in chemical, mechanical and metallurgical systems for the extracting of the precious metals.

As expansion is the order of the day, let us expand on the lines of acknowledged progress. ALMARIN B. PAUL.

San Francisco, June 1st, '99.

The Milling of Arsenical Gold Ores.

The ore of the Eureka & Excelsior mines of Cracker Creek, Utah, is a gold ore of good grade, and the vein is more uniformly mineralized than the average gold-bearing veins. The vein is a fissure in slate with arsenical iron pyrites (mispickel). In the upper or oxidized portion of the vein the gold is largely independent or free, but it exists in such an extremely fine condition that only a very small percentage of it is capable of amalgamation, even by the pan process, and the difficulty is further increased by the incompleteness of the oxidizing process that nature has been carrying on.

In the unoxidized portions of the vein the gold is in chemical combination with the mispickel, and these sulphurets exist for the most part in an extremely finely divided condition, making very fine crushing essential to their liberation.

The milling plant originally provided for the E. & E. mine was designed to crush dry, roast, and then to amalgamate in pans. Had the ore been of as high grade as then supposed, some profit would have accrued, but with the average grade of ore that existed a failure followed.

The next attempt was in the direction of milling by wet crushing and concentration upon vanners. This proved fairly successful and many tons of concentrates going $60 to $100 and upwards have been shipped.

Subsequently it was demonstrated that these concentrates could be given a dead roast in a revolving furnace and the gold extracted, by leaching with cyanide, to within 85% of the assay value.

In this case it is not simply a matter of expelling the sulphur and arsenic, but also of liberating the gold from its chemical combinations.

The crude oxidized ores can also be treated profitably by the same method of roasting and cyanide leaching.

Another example of the successful milling of low-grade arsenical gold ore is that of the Mercur district in Utah. In the case of the Mercur ores the gold is in a free condition and the arsenic exists as realgar, a chemical combination of arsenic and sulphur. It is therefore a question of thoroughly expelling the arsenic and sulphur and of leaching by cyanide, as in the free ore of the district.—Salt Lake Engineer and Miner.

Copper Salts on Amalgamated Copper Plates.

A well-known authority claims that the greenish or greenish-grey film forming on copper plates, often showing various colors, is due to the oxidation of copper in the amalgam; or it may be due to the effect of sulphates in the ore, in which case it would be at least partly a basic sulphate of copper. On good electro-silver-plated copper plates it is probably never seen. It certainly does cause a loss of gold in amalgamation. When it appears the stamps should be hung up and the coppers cleaned. This may be done with ammonia, a solution of caustic soda or potash, or a dilute solution of cyanide of potassium. After removal a little more quicksilver should be rubbed in. If it then appears it should be removed as before, all the amalgam scraped off, and a good coating of silver amalgam rubbed in. If pure silver can be obtained this silver amalgam can be easily made by using about three parts of silver to one of quicksilver. It requires about one-fourth ounce of amalgam to each square foot of surface to be amalgamated. If pure silver cannot be obtained, a good way to make it is to use silver dollars. Dissolve them in a porcelain evaporating dish, or any chinaware dish if such be not at hand, in dilute nitric acid, and evaporate it to dryness over hot water or a water bath. Heat the dry mass gently till it fuses and all the bluish tinge in it is changed to a greyish black. When this point is reached the copper alloy in the silver coin will be changed to an insoluble oxide. Then dissolve all that will dissolve in a very little water and filter into a glass jar. To this add the quicksilver required, and drop in a few bright nails or other iron. The silver will be deposited as metallic silver and form amalgam with the quicksilver, and in two or three days it will be complete and ready to use without other care. It is a good idea to always use silver amalgam on the plates rather than pure quicksilver, because it keeps the surface cleaner and, it is believed, causes a better saving of the gold.—Butte Mining World.

A New Abrasive.

Carborundum, the new abrasive, manufactured in large quantities at Niagara, is about to be applied to the same purposes as emery, and will be offered to the public spread upon cloth, paper and possibly leather. In view of this extension of their business, the proprietors are about to add largely to their premises and plant. This departure will place carborundum in direct competition with the emery, garnet and flint cloth manufacturers of the United States, of whom there are seven or eight. While it has long been recognized that there were great possibilities for carborundum in this field, the manufacturers have been busily developing the wheel and kindred industries. In the new field it is highly probable that the consumption of carborundum will exceed the amount used in wheel and other trades, and it is likely to lead to a large increase of the capacity of the Niagara Falls plant.

Homestake Mining Company.

A special meeting of the stockholders of the Homestake Mining Co. has been called for July 18th, in San Francisco, to vote on an increase on the capital stock of the company from its present amount of $12,500,000 to $21,000,000. This increased capital, represented by 85,000 shares, will be used for the purchase of other dividend paying properties of great use and advantage to the company. For 37,500 shares there will be acquired all of the properties and the entire capital stock of the Highland Mining Co.; for 37,500 shares all of the properties and capital stock of the Black Hills Canal & Water Co., and for 10,000 shares the entire capital stock of the Black Hills & Fort Pierre Railroad Co. It is also proposed to increase the number of directors from five, the present number, to seven.

Mining Summary.

ARIZONA.

(Special Correspondence).—Chloride is enjoying a genuine boom. A great many new buildings have recently been constructed and many new people are coming in.

The Mollie Gibson mine is being equipped with the new machinery which has been arriving for some time. The main shaft of the Tennessee mine is down 300 feet on a vein 12 feet wide.

New discoveries at Stockton Hill are attracting attention to that camp. Some of the old mines are being cleaned out and will be worked again. The ores of this camp, though high grade in silver with some gold, usually contain a large percentage of zinc.

Kingman, June 3d, '99.

Phœnix *Republican*: The San Xavier mine, twenty miles south of Tucson, one of the oldest producers of silver in southern Arizona, was recently purchased by Meyer, Clark & Rowe of the Kansas City Smelting Works, and since then they have had forty men developing the bodies of ore. A. Forbes, Supt., will put men at work in the mine as soon as arrangements can be made. The development of the mine is said to be extensive.——A strike of gold quartz is reported to have been made six miles east of Bisbee. The gold in the rock runs as high as $160 and there are values in silver and copper also. A shipment of ore has been made by the owners, and in the same vicinity a great many claims have been taken and prospecting work is being pushed.——Thirty-five per cent copper ore was struck by the Lowell & Arizona Copper Co. in their shaft. The vein was penetrated at a depth of 168 feet.——The payment of $20,000 has been made on the transfer of the White Star, Challenge, Mountain Star and four other claims, fifteen miles from Phœnix, to the Arizona D. & M. Co., recently organized, with T. Weikal, T. J. Boltz, A. H. Traux, F. M. Thomas and G. Wickler as stockholders. The company will begin work with a force of men and a stock of mining supplies will be sent down. A new steam hoist has been ordered.——A strike in J. D. Lee's mine on Big Bug, near Wood gulch, is said to be very rich. The ledge is 3 feet wide and throughout is rich in free gold. Some of the ore, it is alleged, carries $15 to $20 to the pound, the loose dirt at the sides of the ledge also carrying free gold. This ledge is an extension of one worked by G. Whitaker, from which thirty-six pounds of ore yielded $400. Another report is that a ledge 2 feet wide, carrying free gold, has been struck on the 200 level in the Phœnix mine on upper Big Bug, and ore from a cross ledge 6 feet above the new strike assays six ounces gold per ton.

Kingman *Miner*: In the Merrimac mine at Chloride ore is in sight in every opening. Sixteen feet of ore of good milling value has been cut.——A discovery was recently made by Gerritt & Kier on the east slope of the Walapai mountains. The vein is 5 to 15 feet, carrying $5 gold, forty ounces silver and 50% lead to the ton. Three claims have been located on the lead and all show ore. The lead ore is carbonate. Two shafts have been sunk, one 30 feet and the other 40 feet.——Sinking on the Midnight mine at Chloride has reached a depth of 125 feet. Ore that was being thrown over the dump was assayed and found to contain 11 ounces gold and 133 ounces silver to the ton, besides copper. How much of this character of ore there is in the mine is unknown, as it was cut sinking.——J. Jackman has located the Overland mine on Wallapai mountain, upon which he has been at work. The vein carries good values in gold and silver.

CALIFORNIA.

Amador.

The new shaft of the Kennedy mine being sunk in the hanging wall is calculated to reach the vein upon which the company has worked for years at a depth of 3500 feet.

The Oneida shaft is down 1880 feet. The vein which lies west of the vertical shaft and dips toward it has been opened by crosscuts at the 1500 and 1700 levels and extensive drifts driven. The shaft is calculated to reach the vein at 1900 feet or thereabouts. It is reported that recent development in the mine has discovered several feet of ore worth $15 per ton.

Jackson *Republican*: At the Butte Mountain mine the tunnel has reached the ore body 100 feet below the outcrop, and the ledge has been followed by a drift northward 100 feet. The ledge shows free gold and sulphurets, and it is said to be rich near the hanging wall. The gangue of the vein is different from that of other mines in this vicinity, being similar to that of the Rawhide mine. Supt. Marsh exhibits specimens recently taken out.——The Red Hill mine, owned by H. Eudey of Jackson, is now operated by four men as partners, by agreement with the owner. They state they are doing well. They are prospecting and paying expenses from the ore taken out.——Under the supervision of D. Fisher, work at the Spagnoli mine is progressing favorably. The shaft is down 70 feet.——For fifteen years H. F. Vogt has been developing his gravel and quartz properties at White's Bar. His property consists of a homestead, which is joined on the river side by a gravel claim. Down the river, and adjoining the gravel claim on the river bank, is his millsite. Adjoining this is the Vogt mine, joined on the west by the Golden Cora mine. There are several ledges on the property, the most valuable for milling running from the river through the Vogt and Golden Cora claims. The development consists of a tunnel from the river, an open cut 500 feet vertically above the tunnel and various holes sunk on the ledge from there to the top of the mountain, 1500 feet in elevation. On the river the thickness of the ledge is 70 feet; in the open cut and in the holes sunk its thickness has not been proven. Mr. Vogt has taken a water right to 10,000 inches on the Mokelumne river, above White's Bar.

Calaveras.

San Andreas *Citizen*: The Culbertson & Strouth mine, on the Mokelumne Hill road, three-quarters of a mile from town, is making a promising showing. A tunnel has been driven 600 feet, tapping the vein 155 feet from the surface. There the vein matter runs from 30 to 35 feet in width.——The Big Horn mine, near Murphys, recently passed into the hands of Fresno capitalists, who have organized the Big Horn M. Co., with a capital of $50,000. The president is G. H. Monroe.——The Veritas M. Co., operating the Bode or Fellowcraft mine, has started up the mill. The mill is working on ore that has been taken out long ago. As yet no work is being done in the mine.

Jackson *Ledger*: Burton & McSorley are prospecting for gravel on the J. Kavanero ranch, Camanche. The hole was drilled by machinery and is 8 inches in diameter and 160 feet deep, 20 feet of which is in gravel that prospects well. They have recently bought some property from the McLaughlin estate, on which to continue mining operations.——The new shaft at the Tellurium mine, near Pine Grove, is down 40 feet in ledge matter. The quartz taken out is hauled to the Reward mill, together with that which lies on the dump of the old shaft. Grading is progressing on the old shaft for the erection of a hoist.

Jackson *Republican*: The Del Monte mine, near Railroad Flat, is owned and operated by J. O'Neil & Son of Jackson. They have opened the mine through a tunnel and are milling rock which yields $10 per ton. When the mine was operated twenty-five years ago the ore milled $25 per ton. There is a 10-stamp mill on the property.

El Dorado.

Placerville *Democrat*: At the Boulder mine everything is activity.——Col. Jackson has put a pump in the Darling mine. He will sink the shaft 300 feet farther.——There are 1200 miners employed in this county at the present time.——Work has been commenced at the Blue Gouge under direction of E. Bind. Stoping and drifting are being prosecuted.——During the week the Cosumnes copper mine, near Fairplay, the property of J. Theisen, was sold to a San Francisco company. This property has lain idle thirty-four years, and at one time was equipped with a smelter.——The Cambrian G. M. Co. are increasing the capacity of their mill at Gold Hill to ten stamps.——A new 1300-foot cable was put in the Griffith shaft recently and they have three eight-hour shifts on the engine.

Inyo.

Inyo *Independent*: Supt. Hoskins of the Reward states that his company expects to resume operations soon and will give employment to a large force.

Kern.

Randsburg *Miner*: A. T. Stewart of Los Angeles will do some development work on the War Eagle lying west of the Yellow Aster mines.——Twenty tons of ore from the Continental Chief was recently crushed at the Red Dog mill.——L. Faval, from the State Range, brought in five tons of ore which went $175 per ton at the Red Dog mill.——The Wedge mine had thirty tons of ore crushed at the Red Dog mill which returned $2500. They are getting out more of the same kind of rock.

Los Angeles.

(Special Correspondence).—It is reported that the old King of the West mine near Acton is to be reopened. The shaft is down 150 feet and is very wet. The vein on which the shaft is sunk is 4 feet wide, but is illy defined. It carries carbonate of copper and copper glance, with iron oxide. The ore contains gold also. The high hill near the Southern Pacific Railway, between Acton and Ravenna station, has had many shafts and tunnels driven on copper prospects and some rich ore found, but nothing was ever followed to a conclusion. Under the impetus of a high price for copper and a successful method for recovering the gold, something may be found of more value than heretofore.

Acton, Cal., June 4th, '99.

A test run has been made on ore from the Escondido-Grande mine, seven miles north of Acton, in the Red Rover mill, which demonstrated that but a small part of the values can be saved by battery amalgamation.

On Mount Gleason the Padre mine is being put in order for operations.

Madera.

The Lucky Bill mine on Potter Ridge, four miles southeast of Grub Gulch, has been closed down, cause not stated.

Mariposa.

The matter of ownership of the Big Oak Flat ditch, now before the United States Circuit Court, which in the issue of May 27th was reported settled, and in which the Shawmut & Eagle M. Co. were mentioned as defendants, was an error, through common report. The Shawmut & Eagle M. Co. does not appear as party to the suit. The title of the suit is Merced G. M. Co. vs. Dorwood, et al. The court records do not show that the matter has been settled.

Nevada.

The tunnel of the Cherry Hill gravel mine, near Nevada City, now in 600 feet, is to be extended.

Placer.

The Eureka Con. workings, near Forest Hill, have at last reached the channel after numerous raises and crosscuts to determine the position of the channel. The wash includes many boulders of good size, all much rounded, and the quantity of water is large. A drift has been extended some distance and a crosscut will be run to determine the width of channel at that point. The long bedrock tunnel is 200 feet lower than the channel; and as it passes underneath the channel, about two miles from the lower end of the company's holdings, they will be able by a series of raises to drain all that portion of the channel below them and also that portion above the tunnel, about six miles in all. At present the gold is fine, but too little development has been done to determine much about the general character of this ancient stream. The development of the channel will probably produce sufficient water for sluicing. In addition to this source of water supply, the company controls water in the canyon at the mouth of the tunnel. This discovery is at a point between the old Dix mine below and the Greek mine above, and is presumed to be on the same channel.

Nevada City *Transcript*: The Gravel Hill hydraulic mine at Canada Hill, which has been in operation for several months, has suspended operations, the enterprise proving unprofitable.

Plumas.

Quincy *Bulletin*: During the past winter and spring the Round Valley Con. M. Co., in which D. McIntyre is the principal stockholder, has been extending the lower drift on a 3½-foot ledge. This vein runs east and west and prospects well. Recently the tunnel cut the north and south lode. This was found to be of the same size as the other vein and to prospect equally well. On Monday the tunnel cut a deposit richer than had been exposed before. Two pans of ore and dirt from the face of the tunnel, without crushing the quartz, secured a prospect of $2 in value. The backs are 200 feet high and will be increased as the drift advances. The Arcadia mill will be moved below the mouth of the tunnel.——A. D. McMillan of Crescent says there is copper development on the North Fork three miles below Meadow View. The ore deposit is represented to be 100 feet across. Little work has been done. The property has been bonded to Mr. Carlisle, who expects to open up and test the ore. On the opposite side of the river a continuation of the ore body has been located.

San Bernardino.

It is reported that J. R. DeLamar has bought the Gold Mountain mines, owned by E. J. Baldwin of San Francisco. These mines are on the summit of the Black Hawk range of mountains, forty-five miles east of Victor, and overlook the Mojave desert. The gold-bearing shoot occurs in a deposit of quartzite 40 feet or more in thickness and extending over several square miles of the country. The gold is found in those portions of the rock which are greatly crushed by the movements to which the rock mass has been subjected. The quartzite is stained yellow, red and brown by oxidation of iron sulphide, which is dissiminated throughout the mass in small crystals. Several attempts have been made in the past to operate these mines, but without success. At one time Mr. Baldwin built a 40-stamp mill at the foot of the hill upon which the mines are located, but as the ores are only in part adapted to amalgamation, the process failed. Some of the quartz shows free gold, but usually the gold is too fine to be seen even in panning. It is said Mr. DeLamar will build a cyanide plant of large capacity as an auxiliary to the stamp mill. Should this prove a profitable operation, there is a large amount of material to be operated upon within a mile of the original Gold Mountain mine. This deposit is similar to the Gold Chief mine, at the southern end of New York mountain, six miles west of Manvel, in this county.

San Diego.

(Special Correspondence).—It is publicly stated that the mines at Hedges, owned by the Golden Cross M. Co., and comprising a number of claims, two stamp mills and water pumping plant, pipe line, etc., are to be sold to Col. Isaac Trumbo, who has organized a company for the purpose of purchasing and operating the mines. The price is stated to be $1,000,000. Ever since the appointment of C. W. Pauley as receiver by the courts, the mines have been managed on business principles and have paid largely. The principal mines of the group are the Golden Cross, Golden Queen and Golden Crown. The camp is situated four miles from the railroad in a direct line and is in a sort of cul de sac in the rugged hills. The water is pumped through a double pipe line twelve miles from the Colorado river.

Yuma, June 2nd, '99.

Shasta.

(Special Correspondence).—F. Hurst is developing a property one mile from Shasta which he has bonded from F. Dobrowski on a basis of returning 50% of the net proceeds. The wagon haul to the smelter is three and one-half miles. A recent shipment of twenty-five tons yielded $14.72 per ton. Four men are employed.

J. M. Basset, who has reopened the Eureka mine, one mile west of Shasta, is making a 100-ton haul to the smelter. The ore assayed from $14 to $23 per ton.

C. D. Galvin is employing eighteen men, developing forty copper claims near Iron Mountain.

A San Francisco company is pushing development on the Ballakalela and Windy Camp copper properties, which are under bond.

R. R. Watts is opening a property near the Mt. Shasta mine that has an 8-foot ledge of ore.

Development at the Mt. Shasta mine continues on a large scale. Eighty men are employed. Sinking is to be continued to 500 feet depth.

Howell & Co. are shipping ore from the Swasey mine and opening the Thompson property, about a mile south of Shasta.

A. Turner has bought the Le Roi prospect at Middle Creek and put men to work.

At the Black Bear mine, near Muletown, four men are breaking ore in a 4-foot ledge. This is another ante-smelter-day property reopened recently.

Shasta, June 6, '99.

Siskiyou.

Yreka *Journal*: The Brokaw hydraulic mine is working one giant on the 60-foot bank.——The Howard mine has been producing high-grade gold ore of late.——The New York Co.'s quartz mine, under the superintendency of J. Thornton, employs thirty men. The main working shaft is down 100 feet and the tunnel has been extended to 175 feet.——Burke, Jordan & Thornton are owners of a prospect near the New York Co.'s property and report the vein 30 inches wide at the surface, the average value being $30 per ton. A mill test will be made.——Work will commence at the Erno gravel mine. A 70 H. P. boiler is on the way and will replace the old one. Page & Co., who are running the mine, have determined that there are two pay channels and have sunk a shaft between them.——Drake Bros. have discovered a cinnabar deposit two miles northwest of Oak Bar, one and a half miles from the Klamath. The deposit shows a width of 50 feet.——A quartz discovery has been made on Horse creek by C. F. Grader. The vein shows a width of 2 to 8 feet. Gold shows plainly in the ore; the owner has been working with a hand mortar. An arrastra is being constructed.——H. S. Bartons has reopened his Oak Bar mine. Bedrock has already been reached.——In extending the tunnel on one of the ledges in their group on Sugar creek, Hathaway Bros. found a body of copper ore 7 feet in width. It carries gold values.——It is reported that the Paymaster quartz mine has changed hands and the title is now vested in Bass, McCaw & Neal of the Sheba mine, in Patterson creek district.——The tunnel at the Golden Eagle mine has reached the vein, which shows a width of 17 to 31 inches. A mill is in consideration.

Tuolumne.

Carters *New Era*: Gloucester & McDonald have made a discovery in their mine near Carters.——F. McPherson has completed a new concentrator on his mine, a quarter of a mile from Sugar Pine.——A 125-light dynamo is being placed at the Providence mine. The Providence sawmill, four miles from the mine, is in operation.——Thirty-five men have been taken from the Dutch mine payroll.——At F. C. Culler's mine, near Arrastraville, the vein averages 1 foot in thickness and mills $50 to the ton in free gold. The ore is crushed in a mill the capacity of which is four tons daily. One hundred tons returned $5000.

COLORADO.

BOULDER COUNTY.

(Special Correspondence).—It is believed that most of the milling ores from the Ward district go to the Culbertson mill, near Boulder, where they are treated by amalgamation and concentration.

The B. & M., near Ward, works forty men and ships five cars of ore per week to the smelters.

The Utica mine, one of the steadiest producers in the county, is running lightly now, pending an adjustment of interests among owners.

The Ni Wot, shipping ore from the old workings through lessees, is stated to have produced ore valued at $15,000 within two months.

The new electric power plant of the Dew Drop Co. is in operation, supplying power for the compressor and hoists. Changes are being made in the Dew Drop mill, which is to start up about August 1st.

The Dew Drop and Adit tunnels will be connected by a 300-foot upraise, which has demonstrated the continuity of the ore body between the two.

Col. Brainard, who owns an electric power plant near Ward, is operating a group of mines.

The Ward pyritic smelter has been enlarged, and it is claimed the furnaces will be blown in about July 1st.

The Colorado & Northwestern Railway Co. are considering the extension of a branch from Ward to Eldora, a distance of twelve miles. WASCOTT.

Boulder, June 5th, '99.

CLEAR CREEK COUNTY.

(Special Correspondence).—A recent shipment of ore from the Onie Bell, on McClellan mountain, near Silver Plume, was divided into three classes as follows: First class, 4 ounces gold, 45 ounces silver; second class, 2 ounces gold, 31 ounces silver; third class, .96 ounce gold, 26 ounces silver.

A concentrating mill is to be built on the Mendota mine by Mr. Maxwell.

The Griffith mine, at Georgetown, shipped 250 tons of ore in May. The lower tunnel has been driven 1600 feet. Four levels are being driven on the vein. The value of the ore is 20% lead, 5% copper and over 2 ounces gold. The mine employs forty men.

Idaho Springs, June 2d, '99.

J. H. LeMoyne of Denver, who managed the Hot Pot mine for a long time, has secured the Freeland Extension mine at Freeland and will assume charge. He will put a plant of machinery at the shaft and sink to greater depth. Parties have recently opened up a good grade of mineral through these workings. The adit levels from the old Freeland workings will be driven ahead and connection made.

Amos & Erickson, working the east blocks of ground in the Black Lion, have another body of mineral, that found a couple of months ago having proved a pocket. Development is now proving the entire streak to be of smelting value.

Denver parties have a lease and bond on the Humboldt and Mary Foster mines, provided one of the levels of the Humboldt is driven 500 feet to connect with the Mary Foster, which had some rich ore when formerly worked.

DOLORES COUNTY.

The Emma gold mine of Rico is again producing. The output is thirty tons of high-grade concentrates per week.

The Enterprise mine of Rico is increasing its shipments. The mine gives employment to 125 men and is sending sixty tons per week to the Durango smelter.

GILPIN COUNTY.

(Special Correspondence).—The shaft on the Prompt Pay in Russell gulch has reached 180

feet depth; and an 18-inch streak of ore has been found, running well in copper and lead.

A new shaft house will be erected on the Gladstone & Firenzi, this property being now under bond and lease to the Gilpin & Boston G. M. Co., in the sum of $15,000.

A new shaft house with modern hoist and compressor is being put up on the Rialto under direction of Supt. C. K. Colvin of the Cook M. Co.

Blackhawk, June 3d, '99.

HINSDALE COUNTY.

(Special Correspondence).—A State road is being surveyed, to be completed this year, from a point above Lake San Christoval, this county, to near Animas Forks, San Juan county. This means the establishment and maintenance of a good wagon road from Lake City to Silverton. Gradually the points in the San Juan country are being brought closer together by good roads. WASCOTT.

LAKE COUNTY.

(Special Correspondence).—The production of the Fannie Rawlings, at Leadville, the past seven months aggregated 5537 tons of ore, of the gross value of $209,100. Of this sum, $40,000 went to the company as royalty, $120,000 to the lessees, $50,000 for smelting charges.

The Fortune mine of Leadville is beginning shipments. Its ore is said to average $25 per ton.

Leadville, June 3d, '99.

Leadville *Miner*: La Plata G. M. Co.'s property on Rock hill was an important lead-carbonate mine in early days. The company also owned a smelter. The property has been worked for years by small lessees. J. Harrison and associates are now leasing the property and have been working it for some time. A good stope is opened, from which ores run 74 ounces silver, 40% lead and .06 ounce gold. The lessees have opened a large body of gold ore, which proves the extension of the gold ore channels to the west of the Mike fault. Three hundred feet southeast from the La Plata shaft and at a depth of 300 feet an immense porphyry dyke has been cut which is all ore. The ore is almost all silica, 2 ounces silver, 1¼% lead and 9-10 of an ounce gold. The ore is dipping toward the Hall shaft workings of the Nisi Prius Co. While the ore will hardly pay at the smelter, it is important as proving the extension of gold ore shoots in the silver lead area. Gold values in the ores of the Crown Point are also increasing. Mr. Harrison will erect a stamp mill to handle this new ore body.——The Bray lease has a body of lead-carbonate which nets $20 per ton. The Baker & Wallace lease, in the same shaft, has stopes of lead sulphides which are being sold to the Arkansas Valley Smelter. The lessees of the No. 3 and Klondike shafts are making a heavy output of iron.——The work of the Leadville Pumping Association is progressing. The water in all of the Association shafts is being handled without trouble. The Leadville Home M. Co. is getting the main working levels from the several shafts in order. The recent discovery east of the Starr shaft on the Estrella Co.'s ground has proven to be a strong ore shoot, lying between the porphyry and quartzite. Two drifts are being driven into the ore; one drift shows 5 feet, the other 3 feet of ore, rich in chloride of silver, carrying 40% lead, and will average $100 per ton. At the Weldon shaft 40 feet of the connecting drift is yet to be retimbered. The work of breaking ore has commenced. Mgr. T. S. Schlessenger has adopted the eight-hour system, commencing June 1st. Wages at the Weldon mine are $3 per day.

MINERAL COUNTY.

(Special Correspondence).—The Nelson tunnel, in Creede district, which is in nearly 6000 feet, is cutting through Bachelor mountain in a southeasterly direction, paralleling the one great vein of that mountain on which the mines of the Bachelor, New York, Last Chance, Amethyst and United Mines Co. groups are located. The tunnel strikes the ground of all these properties at from 1400 to 1600 feet depth on the slope of the vein. Its main object is that of drainage and ore haulage. Ten days ago this tunnel was connected by a crosscut with the Last Chance workings, speedily relieving the latter of surplus water. The breast of the tunnel is now within 2000 feet of the Amethyst workings, with which crosscut workings are soon to be made. As the tunnel advances the grounds of the other mines will be reached in the same manner, with the result that probably by July or August all the big mines of Bachelor mountain will be drained and their deeper workings put in shape to produce. The Commodore, the largest producer in the district, is on the same vein as are the others named, but having its own tunnel, and will have no connection with the Nelson project.

Creede, Colo., June 5th, '99. WASCOTT.

MONTEZUMA COUNTY.

The Omaha placer at Mancos has found a large deposit of gravel in a rift in the rim rock, extending far into the bank. The gravel is rich and the gold coarse.

SAN JUAN COUNTY.

Denver *Republican*: The Silver Ledge mine, Chattanooga district, has again commenced operations, J. B. Warner of Denver having organized a company which will operate it. The mill has been remodeled by Mgr. Warner. It has a capacity of fifty tons per day. Several men will be worked on development of the ore bodies. The new company is composed entirely of Ohio capitalists, with M. I. Armes Pres.

SAN MIGUEL COUNTY.

(Special Correspondence).—The Japan mine and mill in Savage basin are running full force. A recent strike on this group was in quartz, rich in free gold, at 250 feet depth. By reason of this the Japan Co. are planning to enlarge their mill and to provide amalgamating facilities, the ore on the original group being purely a concentration proposition.

The Columbia, at the foot of Savage basin, is working a small force in the mine and the management is preparing to start up the mill. Nicholson & Newhouse are in control.

The mill of the Liberty Bell, near Telluride, is operating with forty stamps, the product being a concentrate. The ore, which carries gold values in sulphides, is delivered from the mine to the mill over an 11,000-foot tramway line.

The Smuggler-Union, now belonging to the New England Exploration Co., will add 200 tons daily capacity to their present large concentration mill at Pandora. N. T. Mansfield resigned the management of this property when the present owners took possession and has been succeeded by Mr. Miller of Aspen.

It is reported that the Bessie M. & M. Co. are making such changes in their mill in Turkey Creek basin as are necessary to provide for cyanide work.

Parties are at Telluride who contemplate putting up a 100-ton custom mill between that town and Pandora.

The Meidrum tunnel, driving from near Pandora to Red mountain, is in about 3000 feet. Recently a vein of good width was crosscut, on which they are now drifting. The product is said to be a good concentrating ore.

At Ophir the Suffolk is running with forty stamps, and the Carribeau mill, which was damaged in a snowslide, has been repaired and is operating as formerly.

The Butterfly mine and mill at Ophir loop, which belongs to J. K. Benson of Silverton, is operating again. Robt. Neely is Supt.

The Alta mine, in Turkey Creek basin, is shipping two cars a week of high-grade ore. The Alta belongs to N. T. Mansfield, A. J. Clark and others, who contemplate erecting a concentrator.

The Gold King mill, of which Col. McCoy is Mgr., has started up on Gold King ores.

F. Butterfield has completed a mill in Bridal Veil basin to run on Waterloo ores in Gray's basin.

The Nellie mill, up Bear creek, recently resumed work with twenty stamps. E. J. Field is Mgr.

The Tom Boy mill, in Savage basin, is treating 200 tons of ore per day, being an increase of forty tons over that of six months ago.

Pandora, June 2nd, '99. WASCOTT.

Work on the new 200-ton mill of the Smuggler-Union mine at Telluride has commenced and it is expected that the mill will be completed the present season.

The recent strike in the Silver Tip mine, Ophir district, is one of the best ever made in the district. The paystreak is 10 to 12 inches wide and carries assay values of from 1200 to 1300 ounces in gold, the average of the entire streak being $350 per ton.

TELLER COUNTY.

(Special Correspondence).—The C. O. D., whose workings were submerged in water for months, has been pumped out. The property, owned by outside parties, is under lease. Sinking is to commence and shipments of ore from the eighth level will begin.

The Woods Investment Co. are now owners of the Clyde, on Bull hill. A vein of ore was encountered in sinking a shaft at 165 feet depth.

A good showing of ore was found on Friday on Tenderfoot hill by T. Fagin.

N. B. Williams, Pres. Isabella M. Co., whose group of mines is on Bull hill, is reported as saying that the vein matter encountered in the tenth level is from 30 to 50 feet wide, but that the ore therefrom is too low grade to ship; that since February 25th there had been 2000 feet of new work in sinking and drifting on the tenth level, under stopes of higher levels, without finding ore of paying grade.

The output of the Legal Tender, on Bull hill, Cripple Creek, for the month of May was 3600 tons. It is given out that new ground is being opened and more men put on.

The production of the Los Angeles mine on Bull hill for the year ending June 1st, '99, was 2848 tons of ore. The average value of the product for the first seven months was $20 per ton, for the last five months $42 per ton. The Los Angeles is being worked by lessees.

The Last Dollar, of which C. Walden is Supt., is situated on Bull hill, near the Los Angeles. Its shipments for May amounted to fifty-three cars.

The Zenobia shipped twenty-five tons of two-ounce ore on the 2nd inst.

The Whipp & Glenn lease on the Pinnacle is in good ore and better hoisting facilities are being provided. A two-car shipment of ore was made last week.

Cripple Creek, June 2d, '99.

Denver *Republican*: The production of the Gold Sovereign for the current month will, it is estimated, be the largest in the history of that company. In April 290 tons were shipped by various sub-lessees, and this month it is thought the output will be 300 tons. This result has been obtained without the assistance of the heaviest producing sub-lease, that of the Associated Co. This company has not encountered ore in its crosscuts from the bottom of the winze. The crosscut has now been driven 75 feet. The heaviest shipping lease during May was that held by Stumps & Co. on the Wisper shaft. Sub-lessees from Stumps & Co. have the past week broken into shipping ore across 7 feet. The find was made in the 170 level. A 50-ton shipment from this sent out last week gave $39 per ton. The lessees are prospecting for the same shoot at the 213 level. Lessee Cummings struck a continuation of it in his lease on the Close Shave shaft of the Dante. He has a lead 5 feet wide, 2 feet of which carries as high as five ounces to the ton. The production from Nash sub-lease of the Gold Sovereign for the past two weeks amounted to fifty tons, taken from the level run at the bottom of the winze sunk co-jointly by the Associated Co. and Nash. Stoping has been commenced in the ninth level. This winze is down 100 feet from the tunnel level. It is equipped with an underground electric hoist, is 4½x9, and the lease stipulates it is to be deepened an additional 150 feet.——The Bowling Green, O., Co., which formerly had a lease on the main workings of the Burns, of the Acacia Co., has abandoned it. The property was secured by John Grant, an Aspen operator. The Grant lease covers the Barnes ground to the south end line, and is for a term of two years. Work is to be commenced the first of the month.——Hubbard & Hurley, lessees on the Grouse of the Bankers Co., have a year's extension on their lease from July 1. They made money from their former operations on this ground. There are five parties to this lease, and lately a dividend of $1000 per share per month has been distributed.——Extensive improvement work is now under way on the north block of the Deadwood at Victor. The ground is that operated by the Consolidated Gold Mines, one of the organizations controlled by the Woods Investment Co. of Denver. A new working shaft 4½x9 has been sunk to connect with the winze from the first level. Carpenters are erecting a shaft house, to be 80x66 feet. The company will resume sinking in the new shaft to the 600 point. From the first two levels a heavy production has been maintained for some months. At one point in the first level the stope measures 40x40 feet. Nearly everything broken from this stope was sent to market. ——The recent strike on the old Boyd lease of the Morning Glory of the Work Co. was made while the lessees were deepening the shaft for a 60-foot lift from the 230-foot level, and were within a few feet of the 280-foot point, when the ore began to show in the shaft. The shaft cut the find on the dip, and the width has not been learned.

IDAHO.

Spokesman-Review: The Big Buffalo at Buffalo has a 2-foot pay streak that is rich, and ore taken from this chute is kept separate. Much of the ore is of a chalky nature, similar to the Republic ore. The wood for timbering has to be hauled in by hand on toboggans on a down-hill pull.——The new map of the camp made by Engineer McIntyre shows the camp to be nine miles long and one-half mile to one and one-half miles wide.——Several snow locations are proving good. A number of ledges are being worked on the east side of the belt, in the vicinity of Fish lake, but the values are not high.——The Monte Cristo is crosscutting and shows 6 feet of ore. Assays have not been made public, but samples pan out free gold.——Buffalo camp is divided into two towns—one at the Big Buffalo mill, on Lake creek, the other on the top of the hill, two miles distant, at the Big Buffalo mine.——Snow about Lake creek has settled to 4 feet, but upon the higher levels it still lies 10 to 12 feet deep, making work and travel almost impossible.

MONTANA.

Virginia City *Madisonian*: T. Biesinger, who is working the Zebra mine near Barton gulch, is taking out some rich silver ore. He is reported to have taken out 150 pounds of almost pure silver. He has ore which assays $9,000. It is said the vein is 5 feet wide; the pay streak is narrow.——The Black Eagle in Barton gulch is being worked by J. Kripper, who has found a body of ore which carries 100 ounces of silver and 20% lead. He shipped 1000 sacks of ore to Butte for treatment; he expects to have his ore treated at Twin Bridges as soon as the smelter there begins operations.——There has recently been found fine copper ore in Barton gulch, one ledge being 7 feet wide, the ore carrying 9% copper. ——C. E. Damours reports having found rich gold ore in the Lesarge mine at Summit.—— C. Lane and F. Walker, who have sub-leased a part of the Bamboo Chief of Devlin & Grove, have a vein of ore 8 to 12 inches wide, which will average 800 ounces in silver with value in gold.

NEVADA.

The Virginia Miners' Union has demanded that the electricians employed at the underground stations of the C. & C. shaft by the Comstock Pumping Association shall become members of that union. Gen. Mgr. Ross of the Comstock Pumping Association sent the following telegram to the main office:

"VIRGINIA, Nev., June 7th, '99.

"*To Aug. Waterman, Room 23, Nevada Block, San Francisco*: Miners' Union threaten in a written communication to prevent our electricians working at their stations underground unless they become members of the Miners' Union. The men so far have refused to join the union. The union demands that I take action to-day. Telegraph instructions.

"G. McM. Ross."

At a meeting of the executive committee of the Pumping Association June 8 a resolution was passed inviting a committee of the Miners' Union to meet the Pumping Association in San Francisco to discuss the matter.

Reno *Journal*: The Silver Peak property, fifty miles from Candelaria, in Esmeralda county, is reported to have been sold for $1,000,000. The purchasers are said to be Eastern capitalists. This property consists of 200 claims on a number of lodes of gold and silver ore. For the past five years watchmen have kept the camp from being deserted, except for a time when tailings were being worked by the cyanide process.

NEW MEXICO.

The Santa Rita copper mines, sixteen miles northeast of Silver City, have passed into the hands of Eastern capitalists, understood to be the Amalgamated Copper Co. The matter has been pending since June 30th, '98, when the managers of the Hearst estate secured an option from J. P. Whitney of Boston and the companies controlled and operated by him and known as the Santa Rita Copper & Iron Co. and the Bonanza Development Co. for forty-six patented claims and thirty-three unpatented claims, comprising what is known as the Santa Rita mining camp, Grant county, the consideration being $1,200,000 and the term of the option being for three years. The Hearst estate receives $200,000 for its option.

C. F. Grayson has bought a three-quarter interest of T. B. Catron in the Hanover mine, two miles from the town of Hanover, Grant county. The remaining interest is owned by J. B. Gilchrist of Santa Rita. The new owners have commenced operations.

WASHINGTON.

Spokesman-Review: C. W. Barger in February struck a placer on Salmon river, three miles above John Day creek, and gets nuggets in size from that of a pea to one containing $13.20, and he has one larger. The dirt is rich, and one pan of picked dirt gave $16 in gold. J. H. Barger has a small bottle containing $2.35 in coarse gold which he got from one pan of dirt on his brother's claim.——The Palmer mountain tunnel is in 1900 feet and 1000 feet in depth, and is entering a section of the mountain which was rich on the surface. Within the next 1000 feet the Black Bear, War Eagle and Wisconsin Central veins will be cut at a depth of 1300 to 1500 feet. Mgr. Boyd has begun drifting on two of the last ledges cut, with satisfactory results. Twenty men are now employed in the mine. The water power is being developed under the supervision of L. Craddock.——J. Boyd has added to his interest in the Utica, on Douglass mountain. The claim runs in copper and gold. Considerable work has been done and work starts up again on Monday, when a shaft will be sunk on one of three veins which run through a porphyry dyke 120 feet wide. The Utica is a short distance from the Little Falls, recently bought by Spokane parties under the management of D. Hart, who has been doing preliminary work, and has started a force to develop the property. He will begin shipping ore.

FOREIGN.

BRITISH COLUMBIA.

Work continues steadily on properties that have not reached the shipping stage. Among them are the Virginia, Iron Colt, Iron Horse, Homestake, Deer Park, Southern Belle and Snowshoe, Mascot, Coxey, Gertrude, No. 1 Josie, Nickelplate, Great Western, Velvet, Leiter, Wallingford, Sunset No. 2, Mabel, Douglas, White Bear, Evening Star and others. Some of these are nearing the productive stage. The Velvet is in a position to ship, as it has reserves. The Douglas has a vein opened 30 feet in width. The Evening Star has a large chute of ore in condition for shipping. It will market the ore on its dumps and that taken out in development. The Columbia and Kootenay and the No. 1 will market their ores.

Spokesman-Review: On the 1st inst., in accordance with their notice, all the mines in the Slocan and Nelson mining divisions reduced the rate of miners' wages from $3.50 to $3 in consequence of the Legislature having prohibited the employment of men underground for longer than eight hours in twenty-four. The miners' union has threatened to strike around Nelson, although this action has not been universal. The Hall mines are working on the new scale and there has been no trouble. The miners of the Granite mine have gone out, but not the muckers. No one has quit work at the Royal Canadian and the Duncan Mines, Ltd. At Sandon the Whitewater Deep people, who did not join the association, are working fourteen men, paying the old scale for eight hours. The Vancouver and one or two smaller properties near Silverton are employing miners at $3.50 for eight hours. At Ymir all the miners employed at the Ymir mine have quit work in consequence of the reduced rate of pay offered. Both sides are firm. The mine authorities give no hopes of paying more than $3 per shift of eight hours. The miners, backed by the miners' union, refuse to accept less than $3.50. The mill will continue to work, as the mill hands are not demanding any change in the rate of pay, and there is ore on hand to keep forty stamps running night and day for three months. So far the Ymir mine is the only one where a strike has taken place, and it is probable that nearly all the men going out will find employment in the Porto Rico mine. On the Porto Rico, Tamarac and other mines in the vicinity the rate of $3.50 will be paid for the eight-hour day. At New Denver the mines are idle. The union miners employed underground quit work with the last shift in May and refused to go back to work under the $3 scale adopted by the Miners' Protective Association, to date from June 1. The Last Chance mine closed on Saturday, the Noble Five on Monday, and the Payne has reduced its force to thirty-five men.

NEW ZEALAND.

During the first three months of this year the Waihi mine produced 19,391 tons of ore which returned £58,212. Up to date the mine has yielded £958,091 6s 8d.

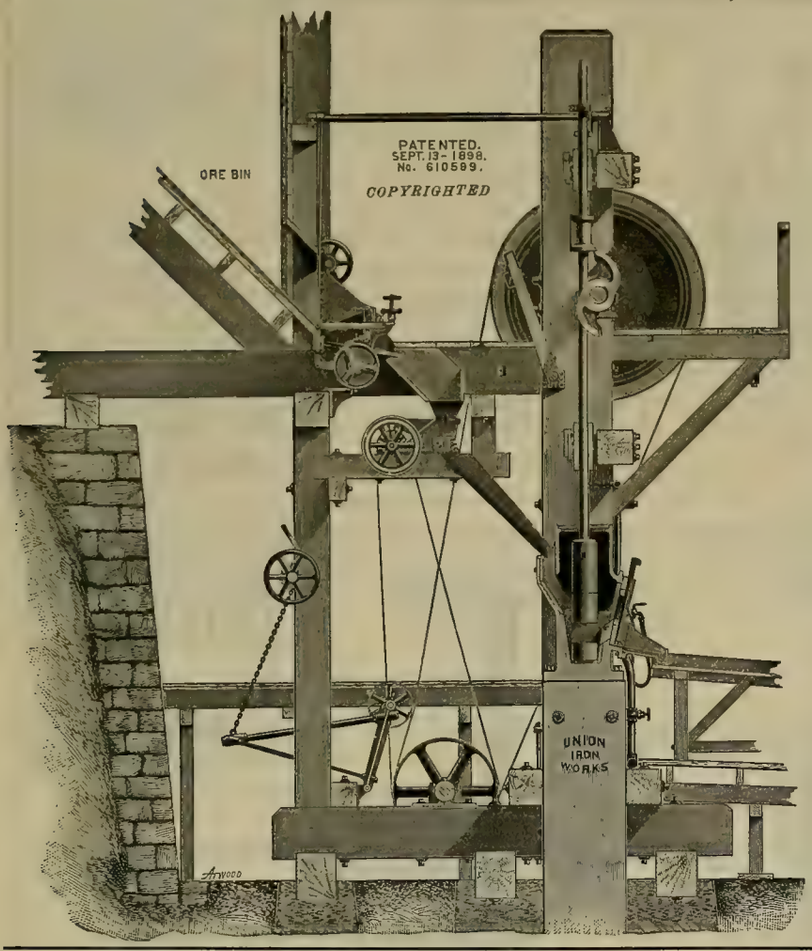
The directors of the Woodstock mine have determined to have the battery power increased, and half a dozen more vanners have been ordered from America. The development at No. 5 level is proceeding, and the reef shows a width of 12 feet, the ore carrying considerable sulphides. Other levels in the mine are being worked and quartz of average quality is being broken.

NOVA SCOTIA.

The Cape Breton Copper Co., Ltd., has concluded a deal for the purchase of two square miles of copper land at Eagle Head, Gabarus bay, Cape Breton. The property has been bonded with the right to conduct prospecting and mining operations pending the term of the bond. A. Whyte, formerly Mgr. of the Little Bay copper mine, Newfoundland, has been engaged as Mgr. Three veins of chalcopyrite ore crop out on the shore of Gabarus bay. On the middle one a shaft was sunk 75 feet several years ago. The location is seven miles from the Louisburg terminus of the railroad, and there is sufficient water in Gabarus bay, close to where the veins crop, for a vessel to load.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.



THIS ILLUSTRATION

Shows our patent Improved Stamp Mill, with Secondary Crusher, which increases the capacity of the ordinary stamp battery from 25 to 30 per cent.

We respectfully invite the attention of those contemplating the erection of new mills to this practical improvement.

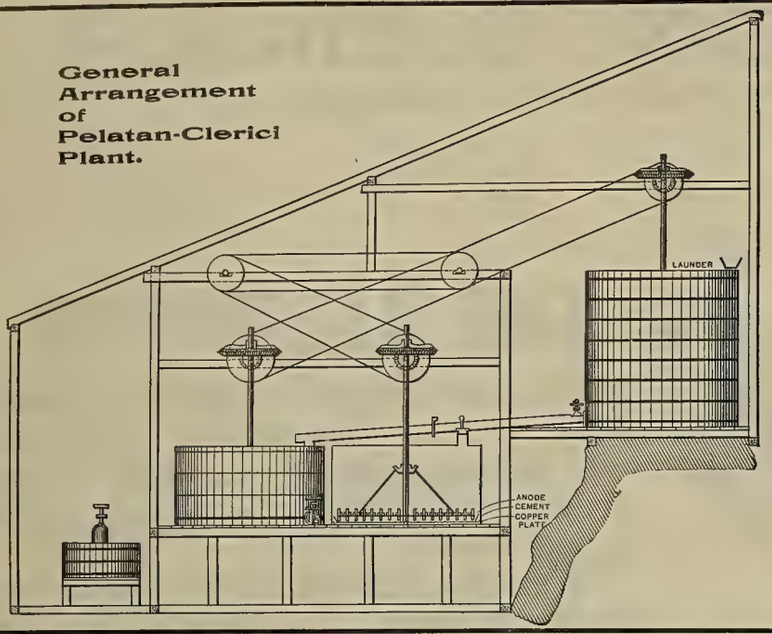
General Arrangement of Pelatan-Clerici Plant.



The "Pelatan-Clerici" Process

OF TREATING REFRACTORY ORES

Saves the precious metals by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process from raw material at less cost. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge. Several mills saving over 90 per cent of values by bullion returns. Simplicity. Economy. Efficiency.

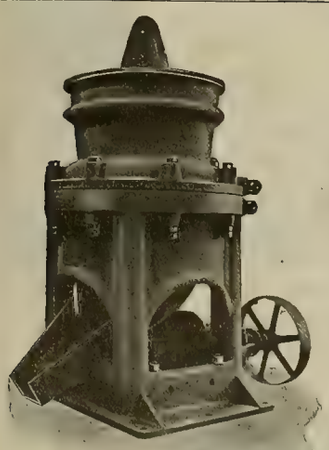
15C-2



GATES FINE CRUSHER.

The result of ten years' solid work. Success at last. What we wanted, and the public demanded, was a Gates Gyratory Rock and Ore Breaker (always adjustable and indestructible) so modified in design as to make one-half-inch product from three-inch sizes, rapidly and cheaply. The H. Fine Crusher will do this work. It takes the place of expensive big rolls and often prepares ore, without further crushing, fine enough for coarse concentration or cyaniding. In any event, it is the greatest and best intermediate machine between the coarse breaker and the pulverizer.

Ask for No. 1 Catalogue. :: **GATES IRON WORKS,** Dept. UU, 650 Elston Ave., CHICAGO.

The above illustration shows the method of holding and sighting BRUNTON'S PAT. POCKET MINE TRANSIT, when taking courses or horizontal angles. The construction is such as to permit of simultaneous sighting and reading. No tripod or Jacob's staff is necessary, and an operator, after becoming accustomed to its uses, can take the Transit from his pocket, take a reading and replace the instrument before a sighting compass can be placed. The most accurate and reliable pocket instrument on the market. Send for illustrated Catalogue B to

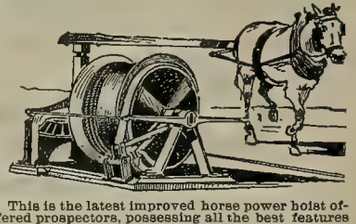
THE CALIFORNIA DEBRIS COMMISSION, HAVING received applications to mine by the hydraulic process from J. H. Southwick, in the North Hill Placer Mine, near Milton, Calaveras Co., to deposit tailings in Rich Gulch; from T. B. Bennett, in the Ohio Mine, near Wash. Plumas Co., to deposit tailings on a flat below the mine; from W. E. Duncan, Sr., in the York Ranch Placer Mine, near Spanish Ranch, Plumas Co., to deposit tailings on a flat below the mine; and from Alfred Schofield, in the Klondike Mine, at Whiskey Diggings, Sierra Co., to deposit tailings behind the dam of the Washington Mine in Slate Creek, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on June 12, 1899, at 1:30 P. M.

EL PASO Automatic Horse Whim.



This is the latest improved horse power hoist offered prospectors, possessing all the best features of other styles with improvements added. The end thrust is entirely done away with, thus increasing the efficiency and saving considerable wear. The Automatic Safety Brake is so arranged that accident is impossible, being in position until held out by operator to lower bucket. ::::: It is made entirely of iron and steel. Weight, about 1400 pounds

Assessment Notices.

THE OLD BONANZA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of April, 1899, an assessment (No. 1) of two and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 163 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of May, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 10th day of June, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 1) has been postponed to SATURDAY, the 10th day of June, 1899, and the day of sale from the 10th day of June, 1899, to SATURDAY, the 8th day of July, 1899.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—163 Crocker building, San Francisco, California.

MAYDAY GOLD AND SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 31st day of May, 1899, an assessment (No. 2) of ten cents (10c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 24 Post street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of July, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 24th day of August, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. P. HEALD, Secretary.

Office—Heald's Business College, 24 Post street, San Francisco, California.

MINING AND SCIENTIFIC PRESS.

AND PACIFIC ELECTRICAL REVIEW.

No. 2032.—VOLUME LXXVIII. Number 24. SAN FRANCISCO, SATURDAY, JUNE 17, 1899. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Value of Comparisons.

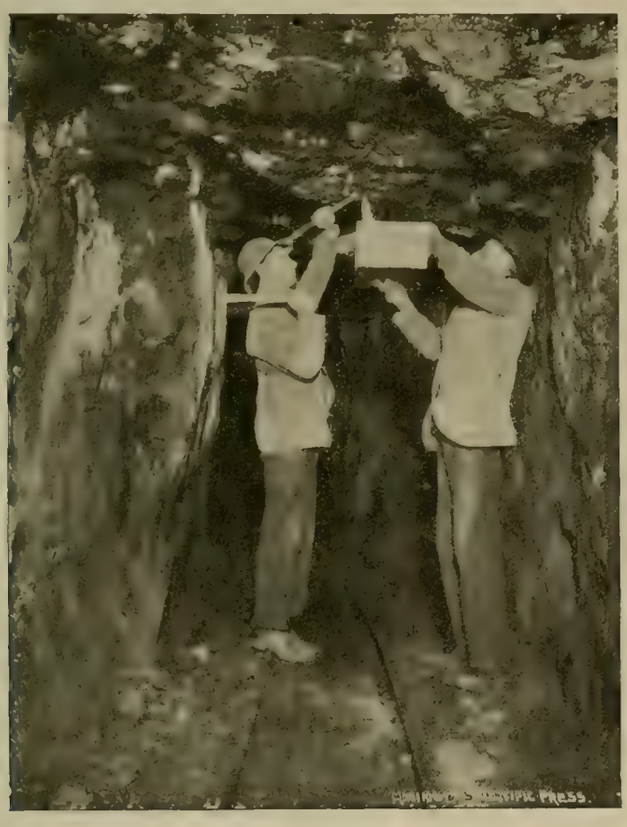
Considering the importance of the mining industry to California, too little attention is given to securing accurate information relative to the cost of operating mines under varying conditions. The simple statement that this or that mine is operating at a cost of $1 or less per ton has no particular significance unless the statement be accompanied by a description of the mine—its geology, character of rocks and of the ore, quantity of water handled, etc. It is only by comparison that these statements are made valuable. If a mine of a distinct type, isolated from all others, and unlike all others, can be operated at a cost so low as to attract attention from mining men everywhere, it has no particular value further than it concerns that mine; but if a mine is only one of a number similar in character and similarly situated, any radical difference in cost of operation would attract equal attention and a remedy would doubtless be sought, for what can be accomplished at one place under certain circumstances should be accomlished at another place where the conditions are the same. A mine may be more cheaply operated with steam, where fuel is very cheap, than one with water power, where the cost of water is very high. The question of wages is also an important one. With a plant of given capacity and a mine of equal size and character, it would cost more to operate a mine in Butte City, Montana, where wages are $3.50 per day than in Tennessee, where wages are about $1.25. It may be that there is greater efficiency in the higher priced labor, but it is not likely that the difference is in the ratio of the respective wages. The same difference exists in the treatment of ores. No comparisons of value can be made when all the conditions having a bearing on the matter are not known. It is to enable mining men to make valuable deductions by comparison that such detailed and accurate information should be sought and made public.

New Old Mines.

Among the most prominent and the best paying mines in California are several which, after the abandonment of years, have been reopened and are now operated successfully. Among these are the Kennedy mine at Jackson, Amador county, and the Gwin and the Utica mines in Calaveras county, also the Rawhide and App mines in Tuolumne county. Besides these, there are a number of others which will probably soon be added to the paying list, including the Central Eureka and Oneida in Amador county, the Melones Con., Sheep Ranch and Angels mines, in Calaveras county, and several smaller mines in Tuolumne and Mariposa counties. Among the most important factors in the development and success of these new old mines are improved methods, superior management, better machinery, lower wages, cheaper supplies and mill processes which save a higher percentage of values at less expense than in former years. The possibilities of these old mines which were once operated with profit and then closed down is fully demonstrated in these recently opened mines, and there are numerous similar opportunities awaiting the investment of capital.

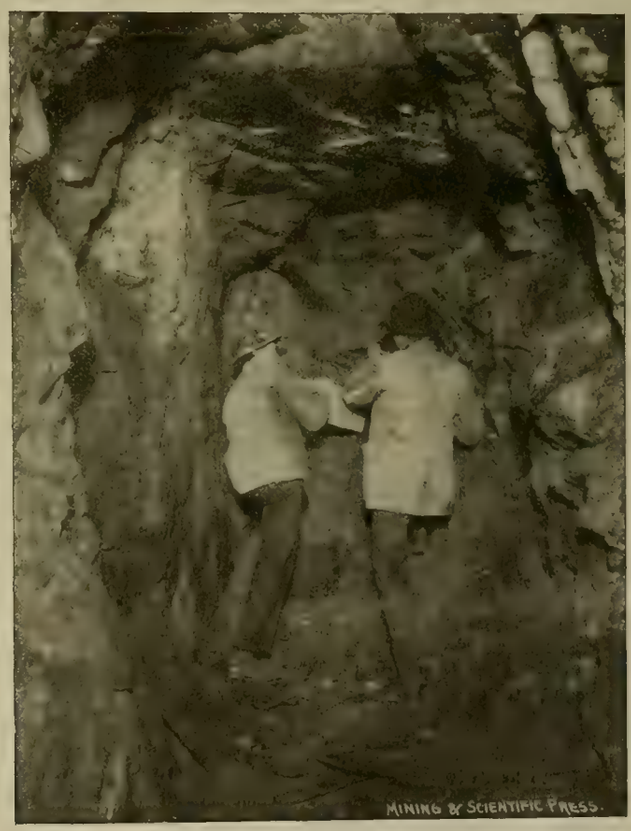
Mine Sampling.

No duty which falls to the lot of the mining engineer calls for an exercise of greater caution than the sampling of a mine. It is a well-known principle that a sample which is not a sample is worthless for either owner or prospective buyer. Often the obtaining of samples is accomplished under great difficulties. The illustrations appearing on this page are those of men in the act of sampling the Independence mine at Cripple Creek, Colo. Under some circumstances the use of the moil is undoubtedly the best for taking samples, as the rock detached by this means can usually be secured in the desired amount, and can be prevented from flying off under the force of the blow, as is often the case in the use of a pick or hammer. The value of the services of a man who can correctly sample a mine cannot very well be estimated on a basis of time.



TAKING SAMPLE IN BACK OF DRIFT, INDEPENDENCE MINE, CRIPPLE CREEK, COLO.

(See page 636.)



TAKING SAMPLE IN FACE OF DRIFT, INDEPENDENCE MINE, CRIPPLE CREEK, COLO.

THE Sauerwald Development & Promotion Syndicate, Ltd., is the title of a new English concern which has gone into the business of gold winning—from sea water. No one will deny that the business is legitimate if they can make a success of it. Metallurgy has made great strides lately, but it has not yet reached a point where the water from the ocean can be made to yield up its gold in profitable quantity. These enterprising promoters doubtless claim to have a sure thing, as did certain New England people not long since. The credulity of some people surpasses belief, for people are said to be actually subscribing for the stock of this salt sea bubble.

STEEL and iron are still rising in price. The unusually large demand for steel and iron and the lateness of the arrival of vessels from the Lake Superior regions at the Lake Erie ports with iron ore combine to keep up the price.

THE new Washington State mining law requires a 10-foot shaft on all quartz mining claims before the act of location is completed. An equivalent amount of work is required on placer locations. The law went into effect on the 7th inst.

PROSPECTORS continue to leave for the new gold fields in Lower California. Some of the most recent reports tend to the belief that gold cannot be obtained more readily there than elsewhere without a proportionate amount of labor.

ON June 1st, when the eight-hour law went into force in British Columbia, 400 men in the Slocan district quit work, for the reason that the mine managers would only pay for eight hours work at the same rate per hour as had been paid for ten hours.

COMMISSIONER OF PATENTS DUELL reports the receipts of the Patent Office for last month to be $116,386.87. For the corresponding month last year the receipts were $88,558.41. The number of applications for patents, including designs, for May, 1899, was 3856, as against 2870 for May, 1898.

A NEW MINING COMPANY has recently been incorporated in Arizona which claims to have 8,000,000 tons of copper, gold and silver ores in sight, in Pima county. This may be considered a very fair start for a new enterprise. No statement as to the value of this ore and cost of mining and treatment is at hand.

THE average cost of the production of gold is lower at the present time than at any time in history, and, as a result, a decided impetus is given the gold mining industry. Attempts to work low-grade ores, where failure resulted a few years ago, are now meeting with success as a result of the changed conditions.

NO CLASS of men in new mining regions do more to retard the development of mines than those who stake all the ground they can possibly cover regardless of the law or the rights of others. Those who would locate and work on claims if they could have the opportunity are unable to buy out these wholesale locators and do not wish to take issue with them at law for obvious reasons, though their case would in most instances be won in the courts. Local rules should limit the number of claims which one person could locate.

Effect of the Eight-Hour Law.

The result of legislative interference, in the passage of the eight-hour law, with a condition of affairs which, if not wholly satisfactory, was at least peaceful, and under which the mining industry and all concerned in it were prospering, is in evidence in Colorado and British Columbia.

Ever since the passage of the eight-hour law by the Colorado Legislature trouble has been anticipated when the time arrived for the law to go into effect, June 15. It is learned that 3000 men employed in various smelting concerns at Denver, Pueblo and Leadville have quit work owing to the differences arising between the workmen and smelter managers as to hours of labor and wages. Several days since notices were posted in and about the smelters stating that thereafter men would be employed by the hour, no man being required to work longer than eight hours during twenty-four, but giving the privilege of working extra time, this being wholly optional. Later a raise of about 10% in wages was announced. That these arrangements did not meet the approval of the workmen is evident. It is asserted that unless the matter is speedily adjusted upward of 40,000 men will be thrown out of employment, as the mines, unable to find a market for their ores, must also close down. The railroads running into the mining districts would also be heavy losers.

In the Slocan region of British Columbia the miners have quit work, refusing to work eight hours for less than the pay formerly received for ten hours' work. That eight hours work is enough in twenty-four in many mines where there are floods of water and poor ventilation, there can be no doubt; but this condition does not obtain in all mines, and the claim that the miners will accomplish as much or more work in eight hours as in ten will scarcely be credited, even if it were so.

In some instances mining companies have also offered to pay by the hour with the overtime privilege, which would be satisfactory, perhaps, in many cases, but would be a violation of the law which makes it unlawful to employ men in a mine longer than eight hours in any twenty-four.

These affairs have reached an unfortunate stage, but it is to be hoped that a just regard for the right on both sides of this question may ultimately prevail. Such things necessarily adjust themselves, as they always have.

"DEEP-LEVEL mining in the Transvaal, as far as the first row of deep mines is concerned," says the *South African Mining Journal*, "has thus far, under careful, experienced management, proved an unqualified success, and the time is not far distant when the second line of deep shafts will enter the ranks of producers." The difference between very deep mining and that which is moderately deep is in some cases so radically different that success may not attend the efforts of those who do not fully grasp the situation in its broadest sense and who are able to meet the changed conditions with the necessary financial outlay. Deep mining—that is, mining deeper than 3000 feet—involves, usually, very heavy surface plants, the lifting of larger quantities of water to greater heights, and, possibly, increased temperature; but, from a mechanical standpoint, it may be said that mining will be carried on to a depth as great as it is possible to sink shafts and hoist heavy loads with a single cable. When a cable is very long—3000 feet or more—the "springing" of the rope is the cause of some difficulty, but the inconvenience caused by this is usually overcome by the use of chairs at the stations. To how deep a point mining can be carried on successfully is not known, but it is believed to a much greater depth than the deepest mines of the present day—about 5000 feet. Economic conditions usually determine the depth to which a mine is worked; but, if the value of ore deposits warrant it, it is safe to say the depth to which mines will be worked will be very materially increased.

WHAT is alleged to be a "petrified man" is being lugged about the rural and mining districts of California by men who claim to have discovered the "man" in Death Valley while prospecting. When last heard from they were headed for Oregon. This sort of "fake" has been worked on the people so often and so frequently exposed, it is amusing to see that the old trick still works, and people actually pay to see such a creation. On second thought, perhaps people who are so easily taken in might spend their money more foolishly. Such a thing as a petrified human body does not exist, and never has. Bones sometimes become petrified, but the fleshy tissues are not subject to replacement in the same manner that bones, wood and some other organic substances are, for the simple reason that the tissues are destroyed by decomposition before the atomic replacement of inorganic for organic matter can be accomplished.

THERE is usually a vast difference in current reports from a mine that is being boomed by every conceivable device for what can be made in a stock operation and one which is worked for what there is actually in it. A great deal of free advertising has recently been given a noted mine location in the Northwest. Statements of fabulous values are commonly made, in connection with enormous breadth of ore bodies. The papers are full of it. During the last four months a large force of men has been reported engaged in development work and have succeeded in sinking a small shaft 60 feet in soft rock. In comparison with this is a gold mine in the Southwest which for months past has shipped several hundred thousand dollars monthly and yet its name in print is a rarity. These two make a decided contrast.

SOME of the United States Consular reports, particularly those which deal with mining and the mineral resources of foreign countries, are of unusual interest. Consul Fowler, writing from Chefoo, China, Feb. 16th, '99, says that, at his request, E. D. Sims of Tai-au-fu has sent an interesting report on the coal and other mines of that department. In his report Mr. Sims writes: "I send you a very good specimen of galena, very rich in sulphide of lead, and I am told it would make very good German silver." The correspondent also writes of a "vein of pure silver assaying from $600 to $1000 per ton." It is unfortunate that consular reports, which should consist of reliable information from the most responsible source, contain such foolish statements as the above.

AT the mines of the Mountain Copper Co., near Keswick, Shasta Co., Cal., 450 miners have quit work owing to a refusal of the management to meet a demand for an increase of 40 cents per day for all classes of labor. Various complaints are made by the men. They assert that the mine is worked in a reckless manner; that the ore is stoped from large masses without sufficient precaution being taken in the way of supporting the ground, to insure the safety of the men, and that, as a result, the ground is settling. This condition of affairs, if it exists, is in itself sufficient cause for refusal to work. It is also claimed that the accommodations are insufficient and squalid and that the food provided by the company is of inferior quality.

A FEW WEEKS AGO every one interested in affairs commercial and political in the Transvaal looked forward to the meeting of President Kruger and the British Commissioner, Sir Alfred Milner, with much hope for an improvement in existing conditions. These gentlemen met, but contrary to the hope entertained by many, failed to arrive at a satisfactory solution of the problems presented. It now looks as though the difficulties are multiplying instead of otherwise. The Uitlanders demand equal political rights with the Boers, and also numerous "reforms" in matters relating to mines. Thus far the Boers have declined to meet these demands.

A FURTHER ADVANCE in the price of silver is predicted by some who are looked upon as authority. The reasons given for this happy anticipation is largely increased use in the arts and manufactures due to low prices of silver, and the greatly extended use of the metal as a circulating medium in Oriental countries now about being opened up, particularly in China.

THE latest in the world of practical science is the effort of Prof. Dewar of London to cast steel in a vacuum, by which means it is thought gas bubbles and blow holes, so detrimental to steel, will be avoided.

Concentrates.

A LEAD and zinc mine is being opened at Bristol, New Hampshire.

LOCATION certificates when placed on record do not require stamps.

A PLACER LOCATION may be made in contiguous tracts of ten acres each.

COPPER and silver ores occur in quartz porphyry in the Lava Beds district of San Bernardino county, Cal.

THE Ontario vein at Park City, Utah, is a vein in quartzite, from which $13,559,500 have been paid in dividends.

IN drifts the bottoms of which are soft and wet, sills should be placed to afford firm support to the posts of the drift sets.

LAND in California more valuable for limestone or marble than for agricultural purposes may be located under the mining laws.

LANDS lying between high and low tides belong to the State, and placer claims located thereon cannot be sold by the United States.

THE slow backward movement of abrupt rock faces due to weathering has been called the recession of cliffs, a very appropriate name.

THE slates of the Mariposa beds of the California gold belt are proven to be of Cretaceous by the appearance of casts of the fossil aucella.

SEDIMENTARY STRATA to a depth of 11,000 feet have been removed by erosion in some portions of the Grand Canyon region in southern Utah.

MICA of merchantable character is found in several localities near Custer City in South Dakota. The mineral occurs in coarse granitic veins.

A SURVEY of a mining claim made before the date of recording the location of the claim cannot be regarded as the official survey contemplated by law.

IT is not necessary that the "discovery shaft" should contain mineral or ore. If mineral in place is found on any portion of the claim, it is all that the law requires.

MINERS can survey their own claims with considerable accuracy by using a common open-sight compass provided with sights and by taking care in making measurements.

WHEN estimating the $500 worth of work necessary to secure patent, any work done by former owners who had abandoned their claim cannot be considered as part of the expenditure.

WHEN making application for a patent to placer ground care should be taken to determine the exact classification of the land, and the clearest evidence possible should be presented.

QUICKSILVER is obtained on the Pacific coast from four minerals—cinnabar, metacinnabarite, native quicksilver and tiemannite (mercuric selenide). This latter occurs in Piute county, Utah.

THE development of a mine is exploration. The stoping and working of a mine after it is developed is exploitation. A good maxim in mining is keep exploration well in advance of exploitation.

A NORMAL FAULT is one in which the hanging wall has sunk relatively to the foot wall, and a reverse or thrust fault is one in which the hanging wall side has moved upward relatively to the foot wall.

A MINING CLAIM is not subject to relocation by other parties until an abandonment by the original locators is established. Non-compliance with the laws, federal and local, constitutes an abandonment.

IT has been asserted that all pyrite contains gold in some amount, but careful tests have been made by some of the most expert chemists of the United States Geological Survey and pyrite frequently found which showed no trace of gold.

IN the early stage of development of a quartz mine it is often impossible to tell whether or not the ground is more valuable for mineral or agricultural purposes. A vein small and low-grade upon the surface may develop into a very valuable mine in depth. Several such instances are of record in California.

THE zone of oxidation in the copper mines of Butte, Montana, ends very abruptly, usually, the oxides and carbonates giving place within a few inches to ores of the normal sulphide type. In the Homestake mines of South Dakota, sulphide ores are found on every level below the 100, but oxidized ore is found as low as the 400 level.

AN anticlinal fold is one in which the strata dip in both directions from the crest of a fold. A synclinal fold is one in which the strata dip toward each other from opposite directions. A quaquaversal fold is one in which the strata dip away in all directions from the crest of an uplift. A monoclinal fold is one dipping in one direction only.

A SIMPLE fissure vein is one having well defined walls, a nearly straight or slightly curving strike and dip. Pieces of the country rock are often included, as though they had fallen into an open crevice. Such a vein as this not infrequently has a banded structure. This is the type of vein frequently figured in textbooks but not often seen in nature.

WHEN using hanging bolts in shafts, use only large sized iron washers. There is no economy in small washers. A 4 or 5-inch washer is far better than one 2½ inches in diameter, for should any downward pressure exert itself the small washers will sink into the plates and there is sure to be a subsidence in the shaft sets. Large washers will obviate this to a great extent.

CHLORIDE OF SILVER is soluble in a solution of hyposulphite of soda, from which the silver may be precipitated in the form of black sulphide of silver by the introduction of sodium or calcium sulphide. These reactions are the basis for the lixiviation process of working silver ores. When ores are not naturally in the state of chloride, they are chloridized in a furnace and the roasted ore leached.

OVER 5,000,000,000 gallons of petroleum are now produced annually in the world. Of this amount 2,500,000,000 are produced in the United States, 2,250,000,000 in Russia, and the remainder is distributed among a dozen countries, Austria 87,000,000, Sumatra 72,000,000, Java 30,000,000, Canada 29,000,000, Roumania 24,000,000, India 15,000,000, Japan 8,000,000, Germany 7,000,000, Peru 3,000,000, and Italy about 1,000,000 gallons.

IN the Manzanita mine on Sulphur creek, in Colusa county, Cal., cinnabar occurs associated with gold. With these minerals are pyrite, and marcasite, chalcopyrite, stibnite, calcite and quartz. The gold is often visible in groups of feathery crystals sometimes in contact with cinnabar and sometimes deposited on the calcite, which is usually more abundant in the ore than quartz. A large amount of native sulphur occurs in the mine.

THE spectroscope is employed to determine the elements in any body when heated to an incandescent state. Distant stars—not planets, but burning suns like that of the solar system, show the lines in the spectrum characteristic of many elements familiar to chemistry. The moon's rays produce none of these characteristic lines on the spectrum, hence it is impossible to say what elements exist in the moon, but the elements of some fixed stars are, according to the spectroscope, singularly like the earth.

EARTHQUAKES are supposed to be due to the readjustment of the earth's surface or crust enveloping the heated interior, which is believed to be slowly cooling. The unequal contraction due to this causes the seismic disturbances. A period of repeated earthquakes is often, if not always, followed by a more or less violent eruption of some volcano. Whether there is a direct connection between the earthquakes and the volcanic outburst, or whether it is only a coincidence, can only be surmised.

WHERE shafts are sunk through ground which is not solid enough to afford good support to the timbers by wedging, reachers should be put in every 30 to 50 feet. These are let into the walls, the ends resting on hitches cut deep enough to hold, and the timber firmly wedged. The plates of the shafts rest on these reachers at intervals and they support the weight of the several sets above as far as the next reacher, or at least such weight as there may be. This keeps the shaft sets firmly in place, and there is little danger of collapse.

THE swelling of rock in mines is due to various causes, among them being a molecular enlargement of the constituents of the rock mass upon being exposed to the atmosphere. In some cases very soft rock is forced into the workings by pressure from the surrounding rocks. The pressure exerted by swelling ground is almost irresistible, and cannot be held by timbers without relieving the ground. It is cheaper in the end to sink the shaft of a mine in the hard rock of the foot or hanging wall rather than in the soft crevice of a vein, the walls of which are swelling ground.

WHEN shafts are sunk in rocks firm enough to stand without timbering the shaft may be divided into two or more compartments by means of heavy timbers placed vertically above each other at stated distances, these timbers reaching from wall to wall of the shaft. To these may be secured the guides in vertical or steeply inclined shafts. In some inclined shafts even these dividing timbers are dispensed with, only plates being put in on the footwall side to carry the runway for skips or buckets, ladders, etc., and only such dividers as are necessary to support air, steam and water pipes.

NOT infrequently one reads of and hears of dykes of quartzite. Quartzite is a metamorphic sand rock formed by an infiltration of some cementing material, such as iron, carbonate of lime, or silica, usually the latter, and in many if not all cases where silica is the cementing material, a secondary enlargement of the individual grains of sand making up the rock mass has occurred, each grain taking on a normal crystalline form. The envelopes of silica which surround the grains coming in contact with each other fill all the interstitial spaces and form a firm, solid rock, so it will be seen that quartzite is in no sense a dyke rock. These beds of quartzite are sometimes also called reefs, which is a more appropriate term.

ON what grade must a flume be built for it to discharge a given quantity of water in a given time? Divide the number of cubic feet of discharge wanted by the area of the section of the flume in square feet. This will give the necessary velocity. Multiply this result by itself and multiply the product by the wet perimeter, in feet, of the flume and multiply the product by decimal .0001114. Divide the product by the area of the section of the flume, expressed in square feet. Call this A. Multiply the velocity in feet per second by the wet perimeter, in feet, and multiply the product by decimal .00002426. Divide the product by the area of the section of the flume, in square feet. Call this B. Add A and B. The result will be the grade expressed in decimals of a foot.

A VERY small amount of iron has been manufactured on the Pacific coast, at Clipper Gap, Placer county. In 1891 furnaces were erected at Roseville near the mouth of San Diego bay for the manufacture of iron direct from ore by the Eames process, but further than the construction of furnaces of the reverberatory type the proposition did not go. By this process the ore was to have been ground to pulp, mixed with retarded coke (coke which has been dipped in clay water and dried) and spread on the hearth of the furnace. Petroleum under blast was to to have been utilized for fuel. The process seemed reasonable, and was in actual use in Pennsylvania, where it is known as the Carbon Iron Company's process, where natural gas was the fuel used, about 30,000 cubic feet of gas being consumed in making a ton of iron.

THE determination of rocks is made in two ways—by chemical analysis and by means of the examination of thin slices of the rock under a microscope. The latter method possesses many advantages, as it shows not only each mineral composing the rock mass, but it also shows the structure and the relations which the rock constituents bear to each other. Internal strains and movements of the grains or crystals composing the rock can be detected as well as alterations from one mineral to another, as the alteration of augite to green hornblende (uralite) and the further alteration of the uralite to chlorite and alteration of the latter to epidote. Each of these minerals may sometimes be observed in a single rock section grouped about a central crystal of augite, showing clearly the transition of one mineral to another, giving information which would be wholly lost by chemical analysis. The use of the polarization microscope, more than anything else, has thrown light upon the alteration of massive eruptive rocks to schistose and slaty condition.

IT is generally conceded by the highest authority that the existence of open spaces are necessary for the formation of ore deposits of any kind. These open spaces may be extremely minute, interstitial openings in fractured, crushed rock mass, or they may be of considerable size in a coarse breccia. The ore may have been deposited in these open spaces between the pieces of the fractured rock mass or in the small cavities between the grains of porous rock, as sandstone. Some ore deposits undoubtedly have been formed by replacement—that is, as the mineral-bearing solutions passed through the rock, atoms of the rock mass were dissolved and carried away in solution, being replaced by atoms of the sulphide minerals now constituting the ore deposit. Bodies of lead, iron and zinc sulphides in limestone are typical of this method of formation, while deposits in sandstone are well illustrated in many California quicksilver mines. There is nothing to support the belief that the spaces now occupied by large ore deposits were at one time open caverns.

CONCERNING the location and recording of mining claims, the United States law says: "The miners of each district may make regulations not in conflict with the laws of the United States, or with the laws of the State or Territory in which the district is situated, governing the location, manner of recording, amount of work necessary to hold possession of a mining claim, subject to the following requirements: The location must be distinctly marked on the ground, so that its boundaries can be readily traced. All records of mining claims hereafter made (May 10, '72) shall contain the name or names of the locators, the date of location, and such a description of the claim or claims located by reference to some natural object or permanent monument as will identify the claim, etc." It will be noticed by the foregoing that miners may organize districts and may also determine the manner of recording. This, without doubt, contemplates the election of a local district recorder, and any record of location properly made with him in accordance with the United States statutes would be perfectly legal. The language of the Civil Code of California, Section 1159—"notice of location may be made with the county recorder," etc., does not make it compulsory. A safe plan would be to record a location with both the district recorder and the county recorder. The county records are usually kept in a safe place where they are not likely to be destroyed by fire or otherwise, while in many cases those of the district are exposed to danger of destruction. If a mining claim is worth anything it is worth recording in such a manner as to insure the validity of title.

WHERE a tunnel is located, under the tunnel right law, for the purpose of the development of a vein or lode, or for the discovery of veins, the owners of such tunnel shall have the right of possession of all veins or lodes within 3000 feet from the mouth of said tunnel on the line thereof, not previously known to exist, discovered in such tunnel, to the same extent as though discovered on the surface; and locations on the line of such tunnel of veins or lodes, not appearing on the surface, made by other parties after the commencement of such tunnel, and while the same is being prosecuted with reasonable diligence, shall be invalid. But failure to prosecute the work on the tunnel for six months shall be considered as an abandonment of the right to all undiscovered veins on the line of such tunnel. A vein discovered in such tunnel not previously located on the surface may be located by the owner of the tunnel, who may take 1500 feet along the line of the discovered vein. When such discovery is made a location notice should be posted on the surface, giving notice of such appropriation and marking it by posts or monuments. This notice should be recorded. The discoverer should raise from his tunnel or sink a shaft and determine the apex of the vein on the surface, and the surface ground included in the location, as in a location made on a surface discovery. This is in accordance with the views of the land commissioner, but the Supreme Court of Colorado held that a notice posted at the mouth of the tunnel, stating at what distance from the mouth of the tunnel the vein was discovered and the number feet on each side of the center of the tunnel claimed, was sufficient.

SHAFT TIMBERS may be cheaply and quickly framed by use of templates, which make all framing uniform. Of the several systems or methods of framing shaft timbers at the corners, the overlap joint is simple and easily made. This method is employed in vertical shafts only and is framed by cutting out one-half the thickness each of the wall plate and end plate to a width equaling the width of the timber. The upper half of the wall plate is cut out and the lower half of the end plate is removed. The wall plates are first placed in position as nearly as may be, being swung on hanging bolts. When both timbers are on the bolts, a gauge is slipped in at each end, by means of which the timbers are adjusted at the proper distance from each other, when they may be secured in that position by tacking a piece of lagging on top of the plates near each end. The end plates are then dropped in and the set wedged to place, which is determined by a plumb line in each corner, suspended from sets above which are known to be in line. The lines should take in not less than three sets in height. If four lines are not used, the sets are likely to be wedged out of line. Lining up sets is a particular job requiring care, patience and good judgment. It pays to do shaft work well, and good enough is only good enough when it can be no better. A slight departure from the true line is scarcely noticeable at first; but, as set after set is put in place with equal carelessness, it soon develops a shaft which is not a credit to anyone. In inclined shafts a dovetailed notch is cut near each end of the wall plates and a corresponding tenon cut on the end plate. The timbers are placed in the same manner as explained above. Timbers framed in this way may also be used in vertical shafts. This latter method requires less timber. Where absolute rigidity is required in shaft sets, it is good practice to put posts at each corner, and in large shafts also at the center, or opposite the dividers. When the shaft is being lagged have the post of the same size as the plates, or, at least, one dimension of the same size. If 10x12-inch plates are used, they should be put in with the 12-inch face upward. The posts should be 8 or 10 by 12, the outside faces being placed flush with the outside of the plates. This will make the posts line up with the lagging, and no lagging need be put behind the posts. The amount of timber required is less, and the saving in time in putting in is an item of even greater importance.

Cyaniding Slimy Ores and Tailings.

Written for the MINING AND SCIENTIC PRESS by MATT. W. ALDERSON.

Part III.—Decantation.

When agitation has ceased, the vat is allowed to stand and the charge settles. By glass tubes, ½-inch in diameter and from 2 to 5 feet in length, the depth of the clear fluid can be easily ascertained. In one or two hours, when material is not very slimy, decantation may be commenced. Fig. 5 gives a good illustration of how this is done. Three-inch augur holes are bored in the sides of the vat, and these are fitted with plugs which are flush with the inside of the staves, so there will be no lodging places for slimes. As there is always more or less grass and rubbish with tailings treated, and these rise to the top of the agitator, a stick is laid across on top of the fluid near the edge of the vat, where the solution is to be drawn off, and before the first plug is pulled. This prevents other than the clear fluid flowing out, and also provides a clear spot at the side, so that when the decantation is near its close one can tell how near he is to the slimes. By proper arrangement of the holes and care in decanting, one can draw the fluid down until not more than half an inch of clear solution will remain in the vat.

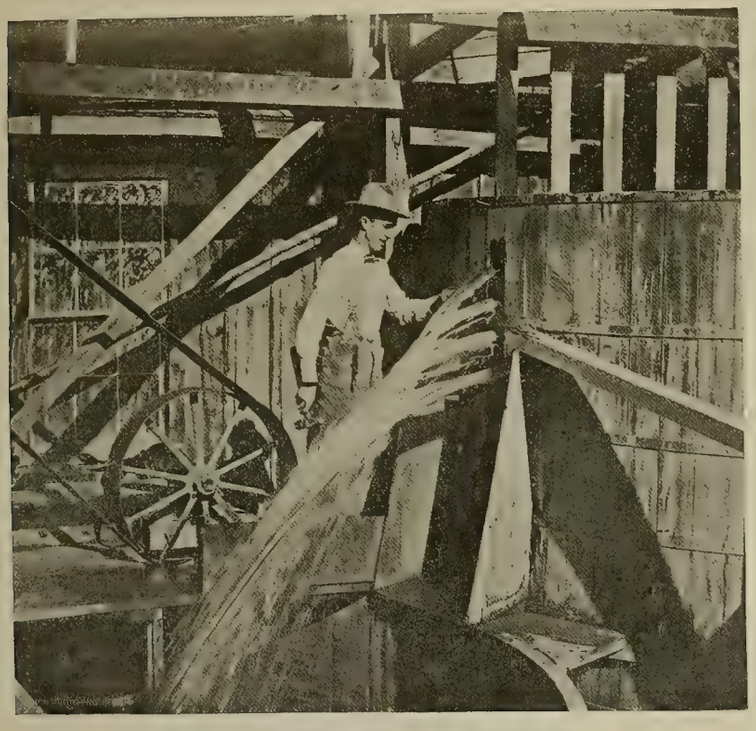

FIG. 5.—DECANTING THE GOLD SOLUTION.

It is important to map out intelligently what one expects to accomplish in a decantation scheme. In other words, the proportion of fluid decanted determines in a measure the extraction. I have known persons to make two decantations of about 40% of the fluid contents of a vat and wonder why their tailings ran high and they were not able to make a good extraction. To make the matter plain, let us suppose we are treating an ore from which we are able to secure an extraction of $10. We have used one ton of solution to one ton of ore. Each ton of solution, therefore, will carry $10 in gold. We make a decantation of 40% of the total fluid in the vat. We have thus secured $4 and left $6. We make another decantation of 40%, taking out $2.40 and leaving $3.60. This latter amount goes out with the tailings, when most of it could have been saved. Suppose, again, our quantity of fluid had been regulated so that we could make decantations of 80%. In the first decantation we would take out $8, leaving $2. In the second decantation we would draw out $1.60 and leave 40 cents to pass out with the tailings. It will be apparent that one would save more money by making but one large decantation than by making three of 40% each.

On most material it will be found of advantage to use two washes, after the first or strong solution, to leave as little cyanide and gold as possible in the charge under treatment. Decantations of the solutions may run from 50% to 70%, but it should be remembered that when they are less than 50% one is leaving a percentage against himself. In the light of the above explanation, it will be seen that it will pay to take time to get a good percentage of the fluid at the first decantation, and that, on the contrary, the waiting of a number of hours for an extra inch or two on the decantation of the final wash may not be justified by what there is in it.

The speeding of a vat comes from so arranging matters that there will be no dragging in the decantations. If, during agitation, the surface of the contents of a vat presents a uniform appearance, the material has not been properly coagulated. The charge will settle if given time, but many hours' time will be needlessly wasted. With a small plant on low-grade tailings, this may mean a loss or a small margin of profit, when, by speeding the vat, the capacity of the plant could be practically doubled, with no additional cost for labor in running the mill, thus making the enterprise profitable. The surface of the vat at the close of agitation should present a mottled appearance, with alternating areas of clear fluid and organic matter. The practiced eye will detect a glassy appearance on the surface, if all is right, and the slimes will commence to go down before the fluid is at rest. Without this appearance and prompt action, it may safely be concluded that an insufficient quantity of lime has been used. The remedy is apparent. The use of other coagulants, such as soft soap, alum, soda, etc., has not been encouraging. Lime is the most effective as well as the most economical. The proper amount should be used at the beginning, as it is hard to successfully "doctor" a vat that does not go down as it should.

The skilled workman can devote his time to other matters while a vat is settling, knowing that he can decant very rapidly when the vat is ready by pulling a number of plugs at a time, as shown in illustration (Fig. 5).

When the final decantation has been completed, the plugs are replaced, the agitator is set in motion, thoroughly stirring up the contents of the vat, and then a plug, about 3x6 inches, at the lower end of the vat is drawn, allowing the tailings to pass out through tailings launder to such place as may be provided for them. The contents of the vat are thus discharged at the rate of about a ton a minute. The average time required for treating a vat, when making these decantations, is thirty hours.

The solutions decanted from the agitator pass to a gold vat. In this is a floating intake, consisting of a piece of rubber hose with outlet on lower edge of the vat through a faucet. The other end is attached to a float which rides the top of the fluid. To this is attached a screen to keep any rubbish from entering the extractor through the tube. The solution thus passes under uniform pressure to the zinc boxes, and such fluid as is drawn off is from the top and is therefore clearest of slimes and other impurities. In the earlier work the gold solution entered the extractor from a vat in which was a filter bottom covered with several inches of sand. This would work well for a time, but the accumulation of half an inch of slimes on top of the filter would effectually prevent percolation of the fluid, and the filter was abandoned for the simple expedient above described.

(To be Continued.)

THE discovery of large deposits of bauxite, which consists principally of alumina, in New South Wales, is of great scientific interest. Previously the mineral in question had been chiefly regarded as iron ore from the point of view of its iron contents. It now appears that it contains more oxide of aluminum than oxide of iron. Whether, however, the manufacture of aluminum on a large scale is likely to be immediately proceeded with is another matter. There has never been any difficulty in obtaining ample supplies of bauxite, which is of little more value in itself than limestone or pipeclay. The trouble is in the limited demand for aluminum itself, and the great cost of its manufacture. Demand is increasing, and the expense of production has been notably reduced of late years, and may still be made considerably smaller. Immense advance, however, will have to be made in these directions before the demand for bauxite begins to be in any way commensurate with the available supply.—Melbourne Standard.

Notes on Mine Sampling.

Written for the MINING AND SCIENTIFIC by GEO. J. BANCROFT.

Sampling a mine is simply a practical application of the doctrine of averages. A number of samples are taken on a vein, the average of which in width and value should represent the average width and value of the vein. The sole object of the engineer is to take such samples in such a manner that the assays of the different samples will form the basis of a correct estimate on the value of the mine.

The day of the expert who walks through a mine with a monocle in his eye, a compass in his hand and comes out and says in an impressive manner, "Gentlemen, this mine is worth so many thousands, so many hundreds, so many dollars and so many cents," is past. His day belonged to the golden past when all mining was considered a grand gamble. Modern science has taken mining from among the speculative ventures and placed it in the front rank of conservative industries. Engineers are recognizing more and more that it is almost criminal to recommend the expenditure of large sums of money on mining property without the most careful and painstaking investigation of all available information bearing on the value of the mine. With careful and intelligent engineering, mining ceases to be a gamble and becomes an industry in which the profits are as sure as in many other branches of industry, and are far greater in proportion to the capital invested.

There are several ways of sampling a mine. Some mines offer special facilities for treating large samples. The ore may be stripped for 6 or 8 inches deep over a section of the vein and the whole lot treated in the reduction works. This is very desirable if it is known just how much of the vein is ore, and if the expenses and time necessary are not prohibitive.

By far the most common method, and withal the most satisfactory, is the taking of comparatively small samples with a hammer and moil and sending each sample to a reliable assayer.

On page 633 are two illustrations showing the writer and assistant in the act of taking samples in this manner in the Independence mine at Cripple Creek.

The values in a vein are very apt to lie in strata parallel to the walls of the vein. Hence a sample should be taken across the vein, being careful to take an amount from each stratum proportional to its width.

The ideal sample would be taken just as a cheese sampler samples cheese. Of course, a vein of hard rock cannot be sampled in practice as one can sample a cheese, but if care is taken the sample will be sufficiently accurate for all practical purposes.

The important thing in sampling is to take the ore exactly as it is mined. There is always a tendency to take more of the soft than the hard. This is, of course, to be avoided, for the soft stuff generally runs higher, but sometimes lower, than the hard. In several camps, notably Cripple Creek and Kalgoorlie, W. A., "screenings" will pay to ship when the coarse rock is worthless. So the hard places in a vein must be patiently chipped off until the required amount is secured.

In regard to the width of the ore, a good deal of reliance has to be placed on the management of the mine, but an experienced engineer will often discover things about a mine of which the management is ignorant. I recall a mine in Cripple Creek which had been stoped for a width of 15 feet. The sampling proved that all the values were in about 2 feet of the 15, and that the rest was so low grade that it was inadvisable to take it out.

Veins that have ill-defined walls should be sampled into the walls a little way, for some of the wall rock is almost inevitably broken with the ore in mining. It is well to have a shot put into each wall every now and then, if the management has neglected it. A large ore body was discovered by the reporting engineer in a mine in the San Juan, Colo., by this simple precaution. The amount of ore to be taken per foot of width varies with the vein. In Bendigo, Australia, it is necessary to take about 10 pounds per foot of width, because the gold occurs in coarse particles and a small sample would be untrustworthy. Where the values are in fine particles and evenly distributed through the ore a small sample is as good as a large one. About 2 pounds per foot is enough in this case. Such veins as those of Gilpin county, Colo., or some of the veins on the mother lode of California may be sampled in this way. Where the values are coarser, or the vein "pockety," large samples should be taken.

The intervals at which samples should be taken vary, also, with the conditions. If an extremely accurate estimate is desired, as for a cash sale, and the vein is high grade, samples should be taken every 3 feet. In other cases 5 or even 10 feet will do. Between these limits the circumstances of the particular case must mould the procedure.

Samples should be taken on every exposed face of an ore body.

It should be borne in mind that it is customary for

miners to sink a winze or put an upraise in the richest part of an ore body. If this is found to have been done, the rich ore next the winze should be figured separately.

No part of the mine should remain unexplored. In an examination of a mine in Boulder county, Colo., a certain hole on the third level was regarded as a sump. In reality it was a winze connecting with an underhand stope from which $30,000 of ore had been removed, and the estimate of ore in sight was consequently very much too high. Of course, the most extreme caution must be taken throughout the entire examination to avoid the possibility of "salting," for, even if the owners are honest, one can never tell what influences may have been at work among the employes of the mine.

Each sample should be assayed separately and the result plotted on a map of the mine. In this way the size, strike and general habit of the ore shoots may be determined. In many cases the information gained in this way is of the greatest importance, and in every case there are sure to be facts enough developed to pay for the trouble.

The surroundings in general and the neighboring mines in particular should be carefully looked into for information bearing on the mine under examination. The possibilities of lawsuits should be carefully considered. It is not pleasant to look back upon a report which recommended the purchase of a lawsuit, no matter how good the showing was.

Once in a while the structure of the district will have a most important bearing on the value of a mine, as, for instance, the "contact" of Cripple Creek, the "indicators" of Ballarat, the "bluestone" of Kalgoorlie or the "great fault" of Cornwall.

The figuring out of the value of a block of ore from the data of the samples is a simple problem, but one that is often done wrongly. If a certain number of samples are taken on a block of ore the common method is to average the values and average the widths. This is obviously wrong, for two variables related as the values and widths of a number of samples cannot be averaged independently of each other and a correct result obtained; but this fact is often overlooked.

My attention was first called to the matter by T. A. Rickard of Colorado, and together we developed a method which we christened the foot-ounce method. Many engineers use the same or a similar method, but so far as I know a description of it has never been printed. In this method the value in ounces of each sample on a given block is multiplied by its width in feet, giving a product which we call foot-ounces. The sum of all the values in foot-ounces is then taken and the sum of all the widths in feet. Both sums are divided by the number of samples, giving the average value in foot-ounces and the average width in feet. The average value in foot-ounces is divided by the average width in feet, giving the average value in ounces. An example will illustrate. Let us consider three samples taken along a drift equal distances apart, as follows: (1) Twelve feet of ore averaging 1 ounce per ton; (2) 1 foot of ore averaging 12 ounces per ton; (3) 6 feet of ore averaging 3 ounces per ton. By the ordinary method we have an average width of $\frac{19}{3} = 6\frac{1}{3}$ feet, and an average value of $\frac{19}{3} = 5\frac{1}{3}$ ounces per ton. This is obviously wrong, as the bulk of the ore is only 1-ounce ore. By the foot-ounce method

12 feet	× 1 ounce	= 12 foot-ounces.
1 foot	× 12 ounces	= 12 foot-ounces.
6 feet	× 3 ounces	= 18 foot-ounces.
19		42

$\frac{19}{3} = 6\frac{1}{3}$ feet = average width in feet.

$\frac{42}{3} = 14$ foot-ounces = average value in foot-ounces.

$\frac{14}{6\frac{1}{3}} = 2.210526+$ = average value in ounces.

By the foot-ounce method, then, we have an average width of $6\frac{1}{3}$ feet and an average value of 2.21 + ounces per ton; by the ordinary method, $6\frac{1}{3}$ feet and $5\frac{1}{3}$ ounces per ton. This is an extreme case, but it serves to illustrate the error which may be made by figuring ore bodies in the ordinary way.

That this method is correct may be seen in the following way: Let us consider the block 30 feet long and 20 feet high, and let each sample represent a sub-block 10 feet long by 20 feet high by the width of the vein at the point where the sample was taken. Let us further suppose the mine is a gold mine, that gold is worth $20 per ounce, and that the ore is of such specific gravity that 15 cubic feet weigh one ton. Then sub-block 1 contains 160 tons of 1-ounce ore, having a total value of $3200; sub-block 2 contains $13\frac{1}{3}$ tons of 12-ounce ore, having a total value $3200; sub-block 3 contains 80 tons of 3-ounce ore, having a total value of $4800. Adding the totals, we find that the whole block contains $253\frac{1}{3}$ tons, having a total value of $11,200. By the foot-ounce method, $\frac{6\frac{1}{3} \times 30 \times 20}{15} = 253\frac{1}{3}$ tons, checking the above; $253\frac{1}{3}$ tons × 2.210526 ounces × $20 = $11,200, also checking the above.

Methods of Testing and Sampling Placer Deposits.*

By EDMUND B. KIRBY.

Every engineer who has had to do with placer work realizes how difficult it is to ascertain, even approximately, the average gold contents of gravel.

The problem presented often comprises gravel beds measured by hundreds of acres, or by miles of gulch bottom. The quantities which it is possible to use for actual tests, whether measured by panfuls or by thousands of cubic yards, are but a minute fraction of the great bulk. Moreover, the distribution of gold in this mass is irregular and uncertain to an extreme. From the nature of the deposit only small portions of it, at best, can be rich enough for pay. These local enrichments are due to the concentrating action of the stream at intervals during its long history. They are therefore subject to all the irregularities which might be expected from its ceaseless shifting, and the changes in the material deposited.

Notwithstanding these difficulties a business decision is called for, and it is always necessary to reach a sound conclusion without spending more time and money than the circumstances warrant. In most cases, therefore, it is best, if possible, to carry on the work by successive steps. If the general evidence examined proves satisfactory, it affords a basis for proceeding to the more simple and inexpensive tests. Encouragement from these will warrant more costly test workings, and the latter may be followed by the heavy and decisive work which is to settle the question at issue.

The Structure of Gravel Deposits.—In most cases presented throughout the West, the gold-bearing gravels are deposits from the present system of streams, and their form and position have probably been developed during the Quaternary period. The high gravels of the California ancient river system are of earlier date and form a class by themselves. As compared with the more recent deposits they are limited in quantity, and differ radically in structure, character of the gravel, grades and methods of working.

Only the first-mentioned deposits are under consideration here. They may be conveniently classed as "high bars" (above water level) and "bottom gravel" (at and below water level). The high bars are remnants of beds which were deposited before the stream cut down its gulch or valley to the present depth. They were originally terraced, but have frequently been shifted or changed in external shape by erosion. They were the most accessible and easily worked deposits, and, generally speaking, are now very scarce.

The deep gravel filling the present gulch or valley bottoms below water level constitutes the principal bulk of the deposits now remaining in every placer district. As a rule, it is inaccessable without the aid of skilled engineering, modern appliances and the use of considerable capital. Of late years these deep deposits have attracted some attention. This is on account of their abundance, and because of the possibilities which may follow their development. The uncertainties and difficulties of such work are very great. It has been best developed by "river mining" in California, and in various districts of the Northwest. During the last few years modern heavy machinery for excavating, hoisting and conveying has been brought into use for this work. Many mistakes have been made in its application, and most attempts of this kind have so far been financial failures. Steady progress is being made in perfecting such apparatus, and there is without question a large field for its application to cases where the conditions are suitable.

It is clear that the climatic and other conditions under which a stream cut down its channel in the bedrock were different from those which prevailed while gravel beds were deposited in this channel. In the first case there was a large volume of water and probably steep grades. In the second case both waterflow and grade must be less, and this is the condition which now prevails in our western rivers and streams. The present grades are generally less than 2%, and the transporting action on large gravel, even in time of freshet, has almost ceased. The bedrock is now protected from erosion by a more or less heavy bed of gravel, over the surface of which the stream flows. In many cases the processes of erosion and deposition have alternated frequently, and this accords with what is known of climatic changes during the Quaternary period.

The gravel beds are made up of various streaks or layers, some of which may be gold bearing, while others are entirely barren. These layers have all the irregularities of stream deposited gravel. They are sometimes quite uniform in thickness and value over considerable areas, as though spread out by floods. In other cases they form crescent-like, overlapping streaks, varying greatly in gold contents, and indicating their deposition in side bars by the stream as it shifted its position. During the deposition of gold-bearing gravel, the light or scale gold is apt to be distributed very uniformly throughout the entire mass. The heavy gold, on the other hand, tends to concentrate out in special streaks or layers. It is a frequent occurrence to find rich layers on top of barren layers, and many facts indicate that, during the deposition of rich gravel, its gold contents do not work down through undisturbed gravel beneath. When pay gravel exists in a gulch, it is generally confined to a ribbon-like layer on or near the bedrock. It is not likely that this is the accumulation of gold which has sifted down from the overlying mass. On the contrary, there is every reason to believe that the bedrock channel for a long period acted like a sluice. As the transporting power of the stream gradually lessened, its gravel was alternately moved and then redeposited. This sluice action, with the repeated shifting and loosening of the first deposits, caused their gold to accumulate in the bottom layers.

This pay lead or bedrock channel is usually of limited width, and meanders along the gulch, marking in general the course and width of the stream at the time. There may be two or more of these channels, and they are not necessarily in the deepest part of the gulch. They may be found higher up, along its sides, as portions of earlier channels, made before the bedrock of the gulch was cut down to its present depth. In such a channel the distribution of gold is very irregular, but, on the whole, it seems to follow the rule so often observed, and is heaviest on the inner sides of bends. It is usually necessary to work the channel by a pit or open cut. It is a rare occurrence to find that the general mass of gravel filling the gulch will average enough for pay. The slope required for the sides of the excavation increases the proportion of this poor gravel, so that the pay lead must be rich enough to bring up the average to the pay point.

Evidence Available in Placer Examinations.—A determination of the average value of gravel is only one of the numerous questions, both business and technical, which arise in a placer examination. It is often unnecessary, because the business decision to be made may be settled by other considerations. Moreover, the books and records of an established placer enterprise will often supply the data necessary to estimate the value of the ground worked. The reliance to be placed upon such evidence is matter for special judgment in each case. Generally, actual tests must be made, and the evidence to be secured may be roughly outlined as follows:

I. General evidence derived from the history, records, facts shown by prior workings and neighboring mines, structure of the deposit, etc., etc.

II. Evidence from sampling gravel already exposed. Such exposures may be found in surface gravel, natural banks and gullies, or prior workings.

III. Evidence from special test workings made for the purpose. These may include shafts down to water level, and such work may be made light or heavy as warranted by the circumstances and the facts developed during its progress.

IV. Evidence from heavy and decisive test workings. In high bars this may merely include a more extensive system of test shafts and drifts in the dry gravel, but in the water-bearing bottom gravel such work is very difficult and expensive. This should not be a serious objection, in view of the heavy investment which will be necessary to open and work a deposit of this character. The very existence of a pay channel, to say nothing of its grade, is uncertain. To risk a large investment on mere chance, without first feeling the way by such preliminary work, is not a course that will appeal to sound business judgment.

On account of the expense of testing gravel, it is impossible to cover a large territory. In practice, all that can be done usually is to select the most promising and workable locality, and decide the question at issue by the value of this portion. The test workings should be so arranged as to define the shape and limits of the pay ground. In a large area or a thick mass, there is no better system than a number of shafts. A channel may be exposed by a crosscut drift from a shaft, and a few cross sections of this kind at different points should give a fair idea of what may be expected from it. Bottom gravel may be 500 to 1500 feet wide, and the main difficulty at first is to locate the position of the bedrock channel. It will generally be best to secure some evidence on this point before starting a shaft. There is no better way of obtaining this than by a line of drop drill holes which will give an approximate cross profile of the bedrock, and will also give some evidence as to the presence of gold and the character of the gravel.

The units of measurement used for placer gravel vary according to the shape of the workable ground. In a thick mass it is the cubic yard. In a thin sheet, with the values on the bedrock, it is customary to use a unit of area such as the claim or the acre. For a channel, a unit of length is preferred, giving the yield per 100 or 1000 feet of length. The extreme irregularities of the deposit are always to be kept in mind, and figures of measurement (like those of value) are to be used with caution. In averaging the results of tests, each should be given a value proportioned to the volume of gravel which it is supposed to represent.

(To be Continued.)

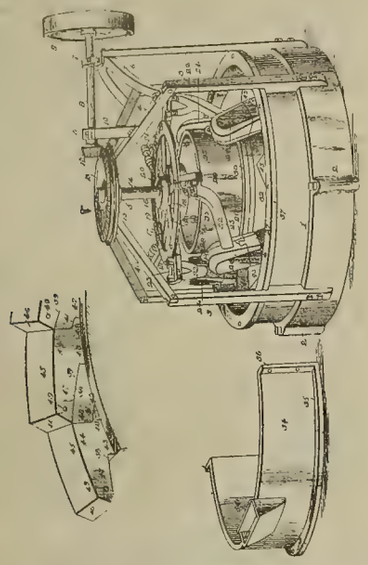
Latest Mining and Metallurgical Patents.

Patents Issued June 6, 1899.

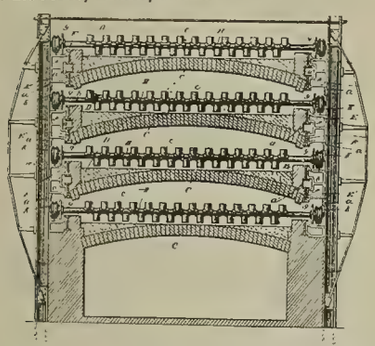
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ORE CRUSHER.—No. 626,326; J. F. Keyton, Baker City, Or.



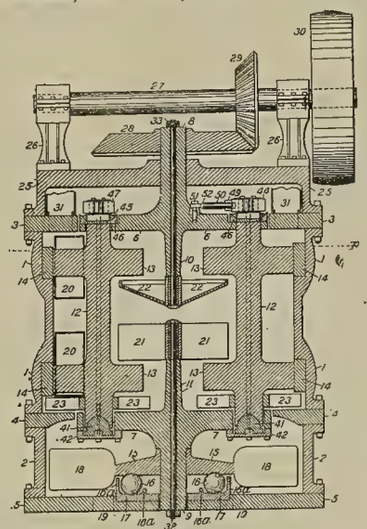
An ore crusher, the combination of a drag wheel involving a hub provided with slots, arms fitted into slots, an annular band or brace attached to arms, the arms being bent or deflected outside the brace, drag arms jointed to deflected projections, and stamps or mullers; the mortar having enlargements with recesses between them to form seats, and a groove at lower portion of one end of each recess, and dies removably fitted over the enlargement and having an under contour corresponding thereto and the recesses between same, and also provided with tenons to engage the grooves.

HEATING OR ROASTING FURNACE.—No. 626,632; W. E. Roberts, Butte, Mont.



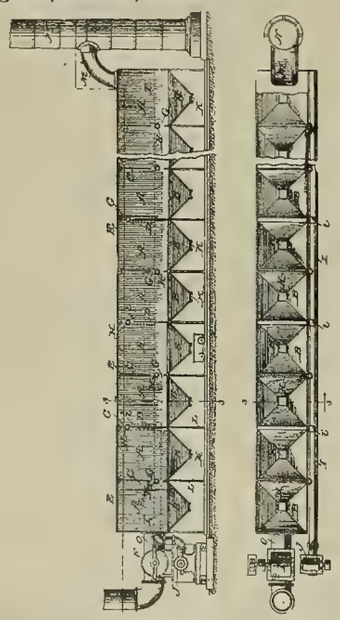
A calcining furnace comprising a series of vertical or upright posts between the ends of the furnace and at suitable localities to insure the strength of the structure, brackets carried by posts, longitudinal I-beams carried by the inner ends of brackets, and distant from posts, an arch of masonry carried by the I-beams, side walls and hearth carried by suitable supports, longitudinal continuous slots through the side walls, and extending from end to end thereof and past the vertical posts, and means for closing longitudinal slots when desired, substantially as described; a series of sets of arches, hearths and side walls of masonry carried by the longitudinal I-beams, each set of arches, hearths and side walls separated from the next adjacent set by longitudinal slots extending laterally from the heating chamber and into the open space between the side walls and the vertically arranged posts, whereby the entire masonry of the furnace may be carried by supports lateral to the side walls and heating chambers and access be had to the heating chambers from one end to the other; furnace composed of a series of ovens or heating chambers one above another, the combination with vertical supports ranged alongside the walls, of horizontal longitudinally disposed beams supporting the roof or arch of one oven, the floor of the next above and the side walls, and brackets carried by the vertical beams and engaging and supporting the horizontal beams; separate longitudinal beams one above another of differing weight and strength, the lower and heavier supporting the roof or arch of one oven and the upper and lighter the floor of the next oven above, in combination with vertical beams or columns ranged along the side walls of the furnace and brackets carried by the vertical beams engaging and supporting the horizontal beams; longitudinal tracks on brackets, continuous longitudinal openings through both side walls and extending past the columns, a rake, the ends of the shaft of which project through the longitudinal openings of the walls of the heating chamber and supports for shaft ends outside the walls of the heating chamber, but within the columns, and resting on tracks for supporting and operating the rake.

CENTRIFUGAL PULVERIZING MILL.—No. 626,426; F. G. Johnson, New York, N. Y.



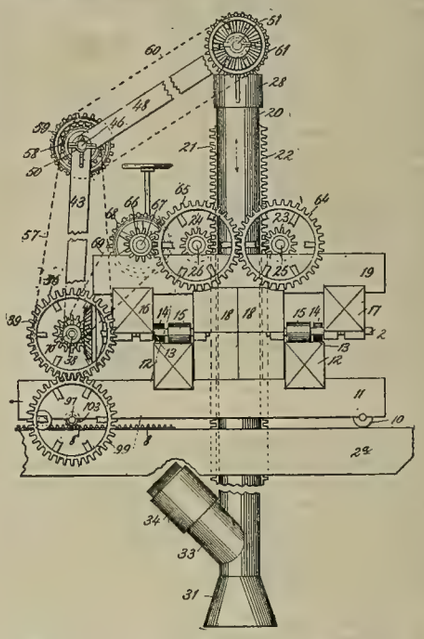
A centrifugal pulverizing mill, two or more vertical roller shafts, each of the same having two horizontal rollers, the upper and lower roller shafts holding headplates *6* and *7* rigidly held together by coupling bars, and each headplate having a central spindle shaft extending toward each other, the lower one of which having mounted thereon a series of radial fanblades, and the upper one of the spindle shafts having mounted thereon an upturned concave disk having vertical radiating partitions, in combination with an inclosing case having annular dies for the tread of the rollers; an upper inclosing case having annular dies for the tread of the said rollers and a lower case having within it an automatic blower mounted on the lower main shaft; the roller shafts having their horizontal support and propulsion in the direction of their circuit around the common center of motion by swivel connecting rods, the movable swivel ends of the rods being secured to the journal boxes of the roller shafts and the fixed ends thereof to the headplates, in combination with a surrounding case having annular dies for the tread of the roller; whereby the roller shafts are immovably held in a vertical position in the direction of their circuit around the common center of motion and yet are free to move and lean in a radial direction.

APPARATUS FOR CATCHING WASTE PRODUCTS FROM LEAD, SILVER OR OTHER SMELTERS.—No. 626,569; W. Sergeant, El Paso, Texas.



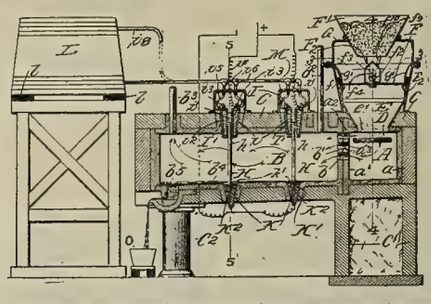
An apparatus for catching the waste product from smelters consisting of the trail or passage composed of settling chambers arranged in succession and having hopper-shaped bottom, baffle plates extending alternately up and down between settling chambers, the transverse air spray pipes extending adjacent to the free edges of the baffle plates, the exhaust fan for forcing the fumes and waste products through the trail or passage, the air main and fan for forcing the air through such main and connections between main and air spray pipes; longitudinally extended trail or passage for the fumes, transverse baffle plates alternately arranged therein and having narrow passages alongside their free edges and the transverse air spray pipes extending adjacent to the free edges of the baffle plates; standards whereby settling chambers are held in an elevated position, the alternately arranged baffle plates partially separating the chambers, the transverse air spray pipes located between the settling chambers and the main connected with pipes.

DREDGE FOR HARD OR SOFT MUD.—No. 626,491; J. T. Ford, Galveston, Tex.



A dredging machine, the combination with a support having an overhanging frame, of a main carriage movable on frame toward and away from the support, a supplemental carriage movable back and forth on the main carriage at an angle to the path of movement of the latter, a vertically movable suction pipe, transverse parallel bars on the supplemental carriage for supporting the suction pipe laterally, and a brake device supported by the bars for controlling the descent of the suction pipe; combination of a stationary support, the drive wheel (*85*) located thereon, a movable carriage for supporting the working parts, the shaft (*88*) mounted on the carriage and carrying the wheel (*96*), the idler arranged in fixed relation to the drivewheel, the movable gear (*91*), and drivechain (*92*), the shaft (*97*) supported by the carriage, and shiftable connection between shafts for reversing the movements of carriage; a vertically-adjustable suction pipe, a gear rack on the same, a pinion meshing with rack, and a brake on the shaft of the pinion to control the descent of the pipe.

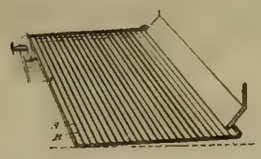
PROCESS OF REDUCING ALUMINUM FROM ITS COMPOUNDS.—No. 626,635; G. Schwahn, St. Louis, Mo.



As a process, subjecting a hot compound vapor containing aluminum to the action of a hot carbon-gas deoxidizer, in the presence of incandescent carbon, for an appreciable length of time, substantially excluding the air; as a process, passing a compound vapor containing aluminum through a chamber from which air is substantially excluded, and which contains incandescent carbon at two or more points between its ends, causing vapor to pass in the neighborhood of incandescent carbon repeatedly during its passage through chamber, subjecting vapor during its passage to the action of a hot carbon-gas deoxidizer for an appreciable length of time, and increasing the heat of vapor during its progress through chamber and while being acted upon by gas, until its temperature is not lower than that of carbon at a white heat; subjecting an aluminous vapor substantially free from silica, any alkali or any metal adapted to alloy aluminum, to the action of a carbon-gas deoxidizer and incandescent carbon substantially

free from silica, alkali or any metal adapted to alloy aluminum for an appreciable length of time, while substantially excluding the air.

CONCENTRATING BELT.—No. 626,461; G. Gates, Jackson, Cal.



An endless traveling belt having a regular general inclination so that pulp delivered at the upper end will flow toward the lower end; broad, flat tubular surfaces at the top of the belt with intervening offsets, each of surfaces declining toward the higher end of the belt and to the foot of the next offset, whereby extended surfaces are formed for the settling of sulphurets and to allow pulp to flow over the surface of the sulphurets thus deposited; an endless, longitudinally inclined belt composed of a series of wide, longitudinally disposed surfaces with shallow, vertical connecting offsets, drums around which the belt is movable, both drums so inclined from end to end that the belt surfaces have a slight downward inclination transversely from the lower toward the upper edge of the belt, and a means for supplying pulp and water along the upper edge of belt; belt having upturned flanges at its edges, drums around which the belt is movable, being inclined transversely of the belt, so as to produce a general flow of pulp from the upper side and end, while the belt surfaces decline from the lower end toward the upper side.

Some Rare Mineral Specimens.

The following recent additions have been made to the exhibit of the California State Mining Bureau in the Union Depot and Ferry House:

Strontianite (carbonate of strontium), Lassen Co., Cal., H. G. Staab; first occurrence of this mineral noted in California.

Crednerite (oxide of copper and manganese), H. C. Davey, Calistoga, Cal.; first occurrence of this mineral noted in California.

Silver ore (stalactite) assaying 140 ounces silver per ton, Esmeralda mine, near the San Marcos coal fields, Sonora, Mexico, Prof. E. T. Dumble.

Hydro-boracite (borate of lime and magnesia) containing 50% of boracic acid, Ventura Co., Cal., J. Ryan; first occurrence of this mineral noted in California.

Meteoric iron; cutting from the Roebourne meteor, found in N. W. Australia, beautifully etched by Prof. H. A. Ward.

Kermesite (oxysulphide of antimony), from near Mojavé, Kern Co., Cal., H. E. Cunningham; first occurrence of this mineral noted in California.

Quicksilver ore from near Clayton, Contra Costa Co., Cal., Dr. Wm. Rider Powell.

Petrified wood from the stump of a tree in Humboldt county, the body of which was worked up into shingles, R. F. Herrick.

Gold quartz, Gold Bug mine, Josephine Co., Oregon, J. D. Ludwig.

Gold in chlorite, New South Wales.

Chrysocolla (silicate of copper), Copper World mine, Ivanpah, San Bernardino Co., Cal., Herbert Lang.

Cinnabar (concentrates from soft ore), Integral mine, Trinity Co., Cal., A. B. McCaw, M. E.

Gold quartz, showing free gold, from a ledge 4 to 5 feet wide near Colville, Mono Co., Cal., Martin H. Shields.

Gold and silver ores from Moore Hill mine, near Cathay, Mariposa Co., Cal., Walter Mayerhofer.

Antimony ore (stibnite), Metallic mine, twenty-four miles from Mojave, Kern Co., Cal., W. A. Johnson, per A. Blanc.

Hubnerite (tungstate of manganese), Runnelville, Cochise Co., Arizona, Prof. Wm. P. Blake.

Rich quicksilver ore, Bryan & Sisk mine, Clover creek, Shasta Co., Cal., J. M. Bryan.

A large number of gold quartz specimens from Calaveras, El Dorado and Placer counties.

Gold quartz, Golden Jubilee mine, Trinity Center, Trinity Co., Cal.; 460 pounds of this rock yielded $220.64 gold and silver.

H. S. DURDEN, Curator.

A NOVEL method of saving gold from tailings, says the *South African Mining Journal*, consists in the employment of a funnel-shaped vessel, with the small end downwards, in which a quantity of water is placed, with a layer of kerosene on top of it. The tailings are put in from above, half a ton at a time, and the agitation of the fluids causes the separation of the gold, which, for some unexplained reason, takes up a position in suspension between the kerosene and the water. A. W. Howitt, late Secretary for Mines in Victoria, vouches for the correctness of the description, his son and a Mr. Godfrey being the patentees. H. C. Jenkins, A.R.S.M., and Mr. Meekinson, the metallurgist and engineer respectively of the Mines Department, have been instructed to investigate and report on this process.

Some Experiences of a Working Miner.

NUMBER XX.

Written for the MINING AND SCIENTIFIC PRESS.

The G—— G—— M—— Co. was a corporation and had an abundance of money, apparently, for speculative purposes, but there appeared to be a dearth of mining talent and a lack of common sense in the outfit. Evidently realizing the shortcomings of the concern, they employed at no small expense a certain Madame B——, whose specialty was divining the whereabouts of rich veins and deposits of gold and other ores, and on a pinch she could make a pretty good bluff at metallurgy and mechanical engineering.

After the company was organized and ready for business Madame took a hand and a large deposit of gravel on C—— creek was investigated; this was found to be very rich in gold, much to the surprise of those who lived in the neighborhood, who had never suspected that the gravel was gold bearing, but Madame went into a trance and, coming out of it alive, positively asserted that the spirit of a departed Indian chief, who had in life inhabited the section where the gravel was found, had told her there were great riches in the bank of gravel. The deposit lay 60 feet or more above the creek bottom and it was apparent the only economical way to work the deposit was by the hydraulic method. This necessitated a ditch. There was plenty of money and a ditch was built five miles in length, but in fear that there would not be sufficient water in this ditch, a second one was dug on the opposite side of the canyon. This was also about five miles long. The two ditches were finally completed and flumes arranged, several hundred feet of iron pipe laid and a full equipment for hydraulic mining put in, and at last the giants were turned on the gravel bank. Piping was kept up night and day for a week and then the water was shut off for a clean-up, to get an idea of how the thing was going. The clean-up showed several panfuls of fine, nicely washed iron rock, and a few hundred specks of gold—perhaps twenty cents in all. About this time Madame B—— had another spell and, as before, surviving it, declared that the chief had not been sufficiently plain in his description of the wealth on C—— creek. It was not in the gravel deposit at all, but in veins of silver-copper ore. A score of quartz locations were made, and open cuts, shallow shafts and tunnels were made, some of the latter nearly 100 feet in length. Not one of these developed anything. The Madame then denounced the chief as a deceiver and rousted out some other kind of a spirit who told her that on a certain hill near D—— there was a rich mine, but no one could treat the ore unless the secret were learned from the aforesaid spirit. The ground pointed out was located and considerable work done. The Madame managed in some manner to get big assays from any of the rock, but somehow the assayers who did a commercial business at D—— could not get anything out of this rich ore. The spirit came to the rescue, however, and told Madame how to build a mill to treat this peculiar ore, and the mill was actually built. It had a single steam stamp with a cylindrical screen. Below were half a dozen shallow pans, each about 8 inches in depth. There were settling vats, and roasters, pulverizers, and I cannot remember what all. It cost over $20,000 and never worked but three or four tons of ore and that contained nothing, and this failure wound up the G—— Co. which had spent over $75,000 on the advice of spiritual miners and had gone broke.

* * *

One can work very close to a lot of gold underground and miss it by an inch or two. Several years ago when the original owners were working the B—— mine it became necessary to cut a hitch in the foot wall, or rather what they called the foot wall, for the purpose of setting in a post. The hitch was cut and a very fair prospect uncovered. That is, some of the pieces of rock chipped out showed a little gold, but it was a mere nothing as compared with what had been taken out a short distance above, and it was looked upon as a sort of small offshoot from the main vein. Years after, when other men were working the mine, they were taking up this foot wall ground, and when they came to the old post it had to come out. It was removed and the rock under it was also cut out, and within a space of not over 100 square feet under and about the post nearly $100,000 was taken out in a few days. The first miners had the prospect but did not follow it.

* * *

Tenderfeet had worked the B—— B—— mine with very indifferent success, and having exhausted their means and having realized very little from the mine went in search of assistance. They found a man after a short time who agreed to put up a grubstake and work himself, being a miner, for an equal interest. When he arrived at the mine and went to the bottom of the inclined shaft, about 30 feet deep, he remarked that the hole was too small to work in and suggested putting a hole in the hanging wall for the purpose of cutting out more ground. Here comes the element of luck, for it was nothing else. One of the original owners thought the hole should be placed on the foot wall side as it would be easier drilling. The new partner made no objection and the hole was drilled into the foot, charged and fired. After a time one of them went down to see the effect of the shot. He had hardly reached the bottom when he called out to those on the surface, "Come down here; gold till you can't rest!" The men above tumbled over each other in their haste to get to the bottom of the hole, and there, sure enough, was gold and apparently plenty of it, and they scarcely rested for several days till they had taken it out, breaking out the floor of the inclined shaft nearly to the surface and getting about $15,000 for their labor. The first two had worked right over the rich streak, within 6 inches to 1 foot of it all the way down.

* * *

Mr. A—— was a well-to-do business man; not rich, but very comfortably provided with this world's collateral. He took the notion to abandon business and to engage in mining. He went to C—— and made his first venture, and it was successful. A few months' work had swelled his capital 50%. His fortunate experience also swelled his head and after six months' experience he concluded mining was the simplest, easiest and withal the most pleasant way of making money. The latter portion of his conclusion was correct, all right, but when it is classed as the simplest and easiest, he who thinks so without having learned so from his own experience had better hesitate. A——, besides being well off and successful, was also obstinate and hard-headed. Having once determined in his own mind to do a certain thing no amount of dissuasion could turn him from his purpose. He was also a scholar and a firm believer in the principles and laws of nature. Near the bar from which A—— had taken a goodly sum in placer gold was a deep hole in the river. This was commonly known as the pot hole. Now, A—— argued: "As that hole is the deepest part of the stream and gold is probably the heaviest substance in the stream, and as the stream has been rich elsewhere, the pot hole must have caught and retained a large amount of gold, for the gold in the stream above the pot hole is distributed for miles along its course, and it is simply a rational conclusion to believe that a large amount of gold has gone into that pot hole and having gotten into it it could not possibly get out." Many others had reasoned in the same manner before about other pot holes to their sorrow. Old and experienced miners told A—— he could get nothing from the pot holes, but he turned a deaf ear to all advice and told them the reason they had failed was from not knowing how to go about it. It was an inexorable law of nature that the gold should seek the lowest places, etc. He went to great expense, built pontoon bridges and had about exhausted his means when ready to reap his reward. Is is scarcely necessary to say what the result proved to be; briefly told, it was no gold. This experiment ruined A—— financially and it really cost him his life, for he was not a strong man physically and the loss of his money brought on illness to which he succumbed. It is simply another illustration of how easily a novice at mining may overestimate his knowledge and capacity to handle a novel proposition.

MINER.

Deep Mining on the Rand.

So far as the first row of deeps is concerned deep level mining on the Rand has, under careful and skillful management, proved an unqualified success, and the time is fast approaching when the second row all along the line will enter the ranks of producers and swell the output and the dividend list. The success achieved has caused renewed inquiry as to the possible depth to which mining on the Witwatersrand bankets may be practically and profitably pursued. Mr. John Hays Hammond long ago gave his opinion that 5000 feet was a reasonable depth to expect to attain both practically and on a commercial basis. Mr. Hammond estimated "that in the case of a deep level mine of 250 claims and with two shafts, each 2500 feet deep, the extra capital which would be required to pay for the sinking and equipment of such shafts would be about £800 per claim." Truscott gives the average profits per claim on the outcrop companies at £31,700, and this is now being exceeded in actual results, £45,000 per claim being nearer the actual earnings. He estimates the extra cost of hauling from 2500 feet to be about 3s 3d per ton, so that, allowing for both factors of increased expense, viz., shaft sinking and haulage, the margin of profit is affected only in a very small degree. For depths of from 2500 to 5000 feet it would seem that an estimate of costs would have to be proportionately increased, but hitherto every year the cost of mining has been reduced, and the probability is that by the time the mines containing the reef at a depth of 5000 feet reach the producing stage their working cost will be much higher than those of the deeper producing mines are to-day.

Shaft sinking is already being done much more rapidly, and new methods and discoveries are constantly being introduced which will have a most important bearing in the future of deep levels.

Diamond and Gold Mining in Minas Geraes, Brazil.

The following interesting description of the diamond and gold mines of Brazil and the methods of working them is from the report of Mr. Dawson, secretary of the United States Legation in Brazil:

Minas Geraes is the most populous State in Brazil. It has 3,000,000 or 4,000,000 inhabitants and its area is about 222,000 square miles. On account of its elevation, the climate is for the most part cool, temperate and healthy. There is no winter in the ordinary sense of the word. The surface is a great plateau with a general height of 2000 to 4000 feet above the sea. It is varied by an extensive river system and mountain chains, the latter rarely reaching an elevation of more than 6000 feet. In the southern part of the State are several lines of railway; coffee is largely exported; immigration has been considerable, and the commercial relations resemble those of the neighboring States, Sao Paulo and Rio de Janeiro. The northern part, including four-fifths of the area, is without railways and is more isolated, self-supporting and characteristically Brazilian. In this region are found the diamond mines. It contains a large population and is one of the most prosperous parts of Brazil.

In mining, Minas is pre-eminent among the States of the Republic. It has produced and still produces by far the largest proportion of the mineral output of the country.

Diamantina lies 680 miles from Rio de Janeiro, and has from 6000 to 8000 inhabitants. As its name indicates, it is the capital and center of the principal diamond district of Brazil. It was founded in the last years of the seventeenth century as a gold mining camp; in 1729 diamonds were discovered. These were at once declared State property by the King of Portugal, and for a hundred years mining of diamonds in Brazil was a Government monopoly. In 1832 the Brazilian Government legalized private mining. Before that time the Government superintendents and contractors had worked the mines with gangs of imported slaves and in a most short-sighted manner. The district shows the indelible results of such a regime. To this day, there is an enormous preponderance of negro blood, and immense deposits of diamond-bearing gravel are irrecoverably lost, because they have been covered with detritus of other workings.

There are six important diamond districts in Brazil:

(1) Diamantina.

(2) Grao Mogul, also in the State of Minas and 150 miles from Diamantina.

(3) The Chapada Diamantina in the State of Bahia, which produces quantities of amorphous and black diamonds, used for making drills.

(4) Bagagem, 200 miles south and west of Diamantina. This was worked as early as the middle of the last century and produced the celebrated Estrella do Sulof, 254 carats; but the general results were unsatisfactory as compared with those of Diamantina and Grao Mogul. The district has been but imperfectly explored.

(5) Goyaz, in the State of the same name, near the River Araguaya, a navigable tributary of the Amazon.

(6) Matto Grosso, 100 miles north of Cuyaba, the capital of the State, and 1000 miles west of Rio de Janeiro.

The first three districts lie on or near the crest of the great mountain chain of the Sierra de Espinhaco, or its continuation under different names, which forms the watershed between the Sao Francisco, flowing north more than 1000 miles before it turns toward the Atlantic, and those rivers which flow directly into the ocean between Rio de Janeiro and Bahia. It is the opinion of experts that these three diamond districts are all parts of a great diamondiferous region extending in a narrow belt along the crest of the sierra and down its slopes for more than 500 miles. It is therefore probable that further discoveries may be expected in the intervals between the districts already productive. That in the vicinity of Diamantina the country rock, from which the diamonds have been washed by erosion into the beds of streams, exists only in the central sierra and not in the side mountain chains, is proved by the fact that diamonds have been found in all, or nearly all, of the streams which flow into the left side of the Jequitinhonha, and none in those flowing into the right bank. The Jequitinhonha is the most famous of all the diamond rivers, and the most extensive and successful operations in Brazilian diamond mining have been conducted in it and its upper tributaries.

Four distinct kinds of mining are practiced in the Diamantina district. The first is the most ancient and simplest. Near the top of the sierra the small streams are very steep in their descent and have precipitous rocky sides. Their beds are filled with boulders, and in the interstices the diamond-bearing gravel is found. This gravel is called the "formacao," and is easily recognized by an experienced miner, for the reason that it contains certain minerals whose presence indicates the diamond. The diamond is a heavy mineral, its specific gravity being about 3.6, much greater than that of ordinary rock. When the original deposits in the high sierra were eroded and washed into the streams, the diamonds and other heavy minerals were separated from the bulk of the detritus by the action of the water. The heavy gravel thus left at the bottom and caught among the boulders is the formacao. There are more than thirty minerals, some of which are always found in it. Among them are tourmaline, specular ore, disthene, rutile, gold and various phosphates. The presence of these shows that the existence of the diamond among them is probable. The formacao is prospected for in the dry season, and as soon as found is dug out and piled near by the water. When the rains interrupt the digging, the miners work up the gravel. The operation is very simple. The gravel is first washed in a "bacu," an excavation a yard wide and a yard and a half long on the bank of a pond or stream. Its lip is a few inches above the surface of the water and it deepens slightly to the rear. A cubic foot or more of gravel is placed in the back end and the workman dashes water against it out of a large concave wooden plate, giving it a peculiar rotary fling. This rapidly separates the lighter and larger stones from the smaller and heavier ones. When concentration by this rough method is as complete as possible, the gravel is worked with the "batea," a wooden dish about 30 inches in diameter, with a sort of pit at the bottom. Filling the batea with the concentrate and water, the workman agitates the contents, whirling and shaking them, meanwhile pouring and scraping the lighter gravel from the top as fast as he separates it. The operation is similar to gold-panning, but requires greater skill. It is said that a man may be a first-rate gold-panner and yet useless for diamond washing. At the end of the process, the diamonds are simply picked out by hand from the remaining minerals. Their peculiar luster makes them easily recognizable even by a tyro. The Brazilian method of washing alluvial gold is substantially that described above. By its use, practically all the diamonds and placer gold which Brazil has produced have been obtained. The native Diamantina miners know no better method.

At present the small stream washings in the Diamantina district are not important or productive. Two hundred years of search has exhausted most of them. Those who work them are usually men with little or no capital. They go in small parties and work somewhat at random, trusting to the chance of finding virgin gravel and making a rich haul. The rewashing of ancient concentrates of the old workings is also extensively pursued.

The second method of mining is that practiced in the beds of the larger streams. The opening of one of these mines is an extensive and complicated undertaking, requiring the employment of thousands of dollars and hundreds of men. At the beginning of the dry season a spot is selected which is believed from tradition or ancient documents to be virgin. Just above the spot selected a rude dam is erected and also a sluice around it, through which the waters of the river are turned. The bed thus exposed is usually found to be of sand, largely the detritus of ancient workings. This sand is carried out a shovelful at a time in little wooden pans on the tops of negroes' heads. Naturally, such a process is tedious and expensive. The work could be done many times more cheaply and quickly with dumpcarts or even with wheelbarrows. From time to time attempts have been made to introduce them; but they have not been successful, owing to the conservatism of the native miners. The excavation is often carried to a depth of 30 or 40 feet before bedrock, where the formacao is to be found, is reached. The hundreds of workmen climbing the slopes of the hole in long lines, each balancing a pan of earth upon his head, look like ants following their paths in and out of a hill. The work is done in great haste, because the first considerable rains in September or October wash away the whole structure and fill up the excavation. The water that percolates into the pit is pumped out with rude pumps worked by overshot wheels, a portion of the river being diverted from the sluice for this purpose. These pumps are simply wooden tubes, in which work leather buckets opening upward. A stream of water is kept continually pouring down from the top to keep them running, otherwise they would not draw. The construction of the sluice, dams and wheels shows considerable primitive engineering skill. No nails or iron are used. The joints are mortised or bound together with vines. The builders have no idea of exact measurements, even the slope of the sluice being determined by the eye alone. Nevertheless, such is their inherent skill that their work nearly always serves its purpose. However, they are unequal to difficult and novel problems. For example, one famous spot in the Jequitinhonha called the Pocao (pothole) de Moreira, reputed to be virgin and fabulously rich, was unsuccessfully attempted several times in the early part of this century. Every time before the bottom was reached the rains came and destroyed what had been done. A few years ago Antonio de Lavandeyra, a Cuban engineer, by the use of modern methods and pumps, succeeded in reaching and uncovering the bedrock. The practical results were a good example of the discouraging uncertainty of diamond mining. Only four diamonds were found. It is now believed that one of the early contractors, in the good old days before the formacao in the Jequitinhonha had been covered up with sand, had exposed or dredged the spot and taken out all the diamonds, and then had not thought it necessary to make any record of his doings for the Government or posterity.

The whole bed of this richest of all diamond rivers, from its source to Mendanha, fifty miles below, has probably been worked. Below that point the valley is too broad and the bed too much choked with sand to permit operations of the kind I have just been describing.

The gravel found is carried out of the excavation and placed in piles until the enforced leisure of the wet season gives a convenient opportunity to wash it. If the ground is virgin, the miners are likely to get a rich reward; if the gravel has been washed before, they lose all they have spent. The river mining is usually carried on by a local expert, who forms a company, to which his speculative neighbors and friends subscribe. No foreign capital is employed in it.

(To be Continued.)

White Rock Silver Mine.

The White Rock silver mine, near Drake, New South Wales, which at one time was floated for a million sterling, has been the despair of numerous plucky prospectors. Though it has not returned a profit on the capital expended, it is of great geological interest. E. F. Pittman, the Government geologist of New South Wales, visited the mine. "The White Rock deposit," he says, "has hitherto been regarded as a felsite dyke, intersected by veins of silver-bearing galena and zinc blende. I had never had an opportunity of inspecting it until recently, when I spent several hours in examining the deposit, which appears to me of such an unusual and interesting character that I determined to pay it a second visit during the Easter holidays. In my opinion, the argentiferous material is a volcanic agglomerate or breccia, and forms the filling of a volcanic neck or chimney.

"The agglomerate, which is of a greyish-white color, consists essentially of felsite, and contains numerous rounded and sub-angular boulders, many of which show rhyolitic structure; they vary in size from that of a pea or less up to several feet in diameter. This agglomerate is intersected by numerous minute veins of galena and zinc blende, which in places impart to it the character of a stockwork, while occasionally larger banded veins up to 2 feet in width are seen striking in various directions. These consist of quartz, with galena, zinc blende, pyrites, native silver, ruby silver ore, calcite and chalybeate. The agglomerate has been much silicified by the infiltration of mineral solutions from below, and is extremely hard and tough.

"In form the mass of ore is rudely circular, or rather cylindrical, its diameter being probably about 600 feet, though it is not possible to exactly define its limits, on account of its surface being in places covered by soil. It occupies the floor or center of a circular horse-shoe-shaped valley, the walls of which rise with a regular and rather steep inclination to a height of from 200 feet to 600 feet above it, and are quite isolated from the surrounding mountains. The rock of which these walls are composed is a dark grey felsitic lava, which in one place was observed to have a columnar structure, the columns being vertical.

"The valley has only one opening, which probably represents a breach in the old volcanic cone, and through this opening the White Rock creek, which rises within the circular valley, flows towards Fairfield creek. The diameter of the crater from rim to rim is probably rather more than half a mile. The altitude of the White Rock is about 550 feet above the town of Drake, and the altitude of the highest part of the rim of the crater is about 600 feet more. There is every reason to believe, therefore, that this is the point of eruption from which all the lava and felsite breccias, which have long been known to occur in the vicinity of Drake, were derived.

"The White Rock ore deposit has been worked by an open cut having a length of 150 feet, a height of 70 feet, and a mean width of 30 feet. In addition to this a vertical shaft has been sunk to a depth of 186 feet, and drives of 100 feet and 140 feet have been put in to the north and south at the 180-foot level.

"The geological mode of occurrence of this deposit appears to me to be of peculiar interest, more particularly as there are, so far as I am aware, only two analogous metalliferous deposits known in the world. These are the Bull Domingo and Bassick mines, Colorado."—Melbourne Standard.

THE announcement recently made by the Geological Survey that the coal product of the United States in 1898 was 219,036,000 short tons against 226,287,000 for Great Britain shows that the United States is rapidly gaining upon that country as a coal producer and will soon become the leading coal-producing nation of the world. As an exporter of coal, however, the United States takes low rank in proportion to its production, and stands fourth in the list of coal-exporting countries.

Filter-Press Process of Gold Ore Slimes.*

By WILLIAM MCNEILL.

Various processes have been tried for treating that part of the tailings from stamp-mill treatment known as slimes, which are usually separated from the tailings, to be treated by cyaniding. The difficulty in treating these eliminated slimes is generally admitted to be chiefly mechanical, the gold being in a finely divided and easily soluble state. In the Transvaal the lime or coagulation process has been attended with marked success. Briefly described this process consists in the coagulation of the slimy particles by the addition of lime, settlement of the flocculent precipitate and treatment by weak cyanide solutions which are decanted after settlement. The slimes after decantation contain about 50% of their weight of cyanide solution, which is partly removed by dilution with weaker solutions. It will therefore be seen that this method requires a large amount of solution compared with the ordinary percolation cyanide process, and even with the use of successive weaker washes still leaves in the slimes 50% of their weight of weak cyanide solution, which must necessarily contain a certain percentage of gold.

The coagulation process followed by decantation, as above described, has proved itself an economic success for slimes which are not very rich, and where water is fairly plentiful. The conditions are, however, different on most of the West Australian gold fields, where water is not abundant, and where the talcose, clayey nature of the ores of the oxidized zones renders it impossible to crush them either by a wet or dry process without the production of a large percentage of rich slimes, in many cases carrying as much as one ounce gold per ton of ore.

C. A. Moreing was one of the first to consider the best and most economical method for treating slimes, more especially those resulting from the crushing of West Australian ores. The author does not contend that the coagulation process followed by decantation could not be used with more or less success upon the ores of the character met with in West Australia, but is of opinion that the elimination of the dust or slime particles, and the treatment of the same in the filter-press plant described below, offers in the case of Kalgoorlie and similar ores special advantages. In many cases the author believes that filter presses might be advantageously substituted for decantation methods. Considering the large number of industries successfully using filter presses for dealing with precipitates of a slimy nature which cannot be filtered by the ordinary percolation methods, even when the withdrawal of the liquid is assisted by a vacuum beneath the filter, it might have been anticipated that these appliances would have been more largely adopted for dealing with gold ore slimes than has hitherto been the case. Several previous attempts have been made to employ filter presses for this purpose, but have not been very successful.

The ore at the Hannan's Brownhill mine having been dry crushed and passed through a 25 or 30-mesh sieve, is delivered to a separator, which divides it into about equal quantities of slimes and sands. It is only proposed in this paper to describe the separation and the treatment of the first product, the slimes. The crushed ore, as it leaves the screens, is elevated into the separator, and passes directly into a central conical hopper without the intervention of any automatic feeding appliance. The intermittent discharge from the buckets of the elevator does not materially interfere with the action of the separator, as owing to the length of the discharge chute of the elevator, combined with the construction of the hopper (which when the supply is properly proportioned to the size of the machine, is kept with a certain amount of material at its delivery end), a regular stream enters the machine, the baffle disc rotating with the center spindle further assisting in an even distribution of material. The vertical spindle of the separator is driven by means of the cone pulley and bevel gearing, and imparts a rotary motion to the disc and fan. The material falling upon the disc is thrown off by centrifugal action in a fine spray and subjected at the same time to the action of an air current induced by the fan. This current carries off the lighter particles with it into the outer casing, where they settle down into the conical chamber and are ultimately discharged.

The coarse particles or sands fall down over the grid against the action of the air current and collect in the inner chamber, and are withdrawn as required through the spouts. The separation required can be regulated either by altering the speed at which the machine is driven, or by the adjustment of the circular damper which regulates the amount of the annular opening through which the air current circulates. With some ores a bumping arrangement has been found necessary in order to shake down the material, which tends to collect on the conical sides of the separator, even though these be constructed at a steep angle. Compared with revolving or shaking screens, this separator offers the following advantages: (1) Absence of all screens which are liable to choke and require constant renewal; (2) easy adjustment and regulation of the size of the particles carried over; (3) the same air current continuously circulating within the machine, no dust escapes out of the apparatus.

From experiments conducted by the author upon oxidized ores from the Kalgoorlie fields at the works the makers of the separator, it was found that after reducing the ore by dry crushing so as to pass a 25 or 30-mesh screen, the fine dust particles of slimes could readily be separated. In some instances the sands assayed higher than the slimes, but no great importance can be attached to this consideration, as it evidently depends upon the state of the gold, and if this were very fine the slimes might be found to be the richest. The separator cannot be regarded as a concentrator, but simply as an apparatus for withdrawing the fine dust or slime-forming particles, whose surface is large in comparison to their weight. In many respects its action is similar to that of a hydraulic spitzkasten or pointed box. It may also be pointed out that all gold withdrawn from the slimes will necessarily be in a very fine state of division, and admirably suited for recovery by cyanide if the mechanical difficulty of filtration can be overcome.

The separation of the slimes from the crushed ore having been effected, either of the following methods, or a combination of them, could be used for the after treatment by the filter press: (1) Agitation of the slimes with cyanide solution and delivery of the sludge to the press, finally washing the charge in the press, or (2) if preliminary water or other washes be desirable, to agitate with the same, deliver the resulting sludge to the press and effect the extraction of the gold with the charge in the press by passing through it the cyanide solution, finally washing the charge as before.

In the general arrangement of the filter-press plant at Hannan's Brownhill, the slimes are introduced into vats and agitated by paddle with cyanide solution as long as may be found necessary to dissolve out the gold. The contents of the vat are then run into a receiver and forced by means of compressed air at a pressure of 60 or 80 pounds per square inch into the filter presses, the filtrate or affluent from the presses being delivered through a pipe into a vat, from which it flows in a constant stream through the zinc precipitation boxes to the sumps. The cakes having been washed in position so as to remove any cyanide solution they may contain, the press is opened and the cakes allowed to fall into a truck for tramming to dump.

The pneumatic forcing receiver or montejus consists of a cylindrical steel vessel with dished ends. The pipe leading from it to the press reaches almost to the bottom of the receiver, thus insuring, as soon as the air pressure is turned on, the whole of the contents of the montejus being discharged into the press. Prior to discharging the receiver, the charge is stirred up by admitting a certain quantity of compressed air through a small pipe to the bottom of the receiver.

The filter presses are of the distance frame, flat plate and four-eyed type, each press having twenty chambers forming cakes 28 inches square by 3 inches thick. From experiments made by the author at the works of the manufacturers of the pressing plant at the Hannan's Brownhill mine, it was found that with the slimes of some of the West Australian ores there is no difficulty in forming cakes of this thickness with ore that had been dry crushed. The cakes were examined by A. C. Claudet and found to carry 20% of moisture and to weigh about 130 pounds per cubic foot, from which figures it will be seen that one press treats per charge about 1¼ tons of dry slimes. The operation of filling and washing a charge in the press is as follows: The sludge is forced into the press from the receiver through a passage by air pressure as described. This passage extends through the plates and communicates with the interior of the distance frame. The sludge continues to flow in until it completely fills the space between the plates, the liquid being forced out by pressure through the filter cloths on either side of the plates, and passes through the channels on the surfaces of the plates to the openings to the discharge pipe at the press head, and the opening would also serve for discharge of the effluent liquid during filling, but as it is connected up to the washing pump it is only used for the passage of wash water. After the cell has become compacted with material and no more liquid issues, the sludge inlet is shut and also the valve on the outside of the press. Water is then forced in and along the drainage channel on the surface of one of the plates through the filter cloth placed on this surface, and then through the cake, displacing the cyanide solution, and finally escaping through the filter cloth on the opposite side and out of the press through the opening. The tightening gear and other details call for no remarks, as the designs made may be widely varied without affecting the action of the press.

The chief advantages gained by the use of a press of the type described as compared with the usual type of press with recessed plates and central charging hole, mostly in use for sewage purposes, are that it permits of the cyanide solution contained in the cakes being effectively replaced by wash-water, and any desired thickness of cake secured by the width of the distance frame employed.

The question of the efficiency of washing and displacement of the cyanide solution contained in the cakes by the wash water is one of great importance when dealing with rich slimes, and this point alone would be sufficient to warrant the employment of filter presses in preference to the decantation methods. Experiments carried out on 3-inch cakes show that the washing is most complete, and that uneven percolation does not take place. One simple experiment made to investigate this point was to saturate the cake with a brine solution having a specific gravity of 1.100, and then to wash out this brine solution with water, and observe the rapidity of the fall in the specific gravity of the wash water as it issues from the press. The rapidity of this fall in specific gravity is a measure of the efficiency of the washing, for the drop is comparable to the displacement of the brine solution in the cake, because if channeling or uneven percolation through the cake had taken place there would have been a slow fall in the specific gravity of the wash water delivered by the press caused by the continual withdrawal of some of the brine solution. In many experiments it was found that a quantity of wash water equal to little more than the cubic contents of the cake was sufficient to bring down the brine soluble to 1.001. It is to be regretted that time did not permit of the experiments being followed by others in which the investigations were not only quantitative, but were accompanied by careful chemical analysis of the cakes and wash water. The author has, however, from more than one authority received confirmation of the efficiency of the washing in filter presses, a comparatively small quantity of liquid being generally found sufficient, except when dealing with precipitates of a very difficult nature, and from which it was required to wash away the last trace of the mother liquor, conditions which do not usually occur in the treatment of gold ore slimes. The author is not able at present to give particulars of the cost of the treatment of slimes in filter presses.

As regards the time occupied and the extraction obtained in the filter press, experiments made with 5 dwt. slimes when the mill was first started gave tailings assaying 1 dwt. after three hours' agitation, and the following average time for the completion of the cycle of filtering, washing, emptying and closing the press: Filling press from receiver, 15 minutes; washing cakes in press, 19 minutes; discharging and closing press, 16 minutes; total, 50 minutes.

The advantage of the filter press treatment is that the amount and strength of the cyanide solution can be regulated to suit the character of the ore under treatment. The amount of solution required for the usual cyanide filtration method, say one and one-half times the weight of the slimes, is sufficient to reduce the pulp to such consistency that it can be readily forced into the filter presses. In districts where water is not abundant the small amount of wash water required is also of great importance, for by the use of the press a minimum amount is required to displace the cyanide solution contained in the cakes.

By the successful and economic separation of slimes dry, without the aid of water, and the treatment of separated slimes, the advocates of dry crushing processes may certainly consider that their cause has received no mean impulse, for a process on these lines certainly enables the greater part of the float gold to be secured.

Generally, the author is of the opinion that the future will see filter presses more extensively used for the treatment of gold slimes, particularly in districts were water is scarce and where ores are of such a nature as to be difficult for ordinary filtration, on account of the excessive percentage of slimes produced when they are crushed. A filter press plant is not expensive for up keep, requires considerably less water, and will probably be found to give a greater extraction than any decantation method.

* Abstract of paper read before the Institution of Mining and Metallurgy in London.

Electrolytic Corrosion of Metals.

The extreme difficulty, if not impossibility, of preventing electrolytic corrosion in buried metal structures under certain conditions, is generally recognized, and although many of the best electrical experts in the country have now been grappling with the problem for a number of years no really satisfactory or practical solution has been offered. Nikola Tesla has suggested that were alternating instead of direct current employed for operating various street railways the difficulty now experienced through electrolysis would be done away with. This may all be, but it must be borne in mind in this connection that the application of the three-phase alternating current to street railway propulsion is of recent date and in actual use in but very few localities, and it is therefore scarcely to be expected that the street railway companies of a city such as New York would voluntarily change over to a more or less untried system, entailing as it would an immense outlay in money for new apparatus and machinery.—Electricity.

Mining Summary.

ALASKA.

(Special Correspondence).—Quartz mining is making a good showing here. A few good steady all-around miners can get steady employment here. Wages are $3.50 a day and board $7 per week.

Ketchikan, May 8th, '99.

Juneau *Miner*: Good reports come from some of the creeks in Porcupine district. The news from Porcupine, Calhoun and McKinley creeks is good. All are working, but Trail and Tahkeen are reported bad and men are leaving in disgust. There is too much snow on the ground for mining on most of the creeks. It may be the middle of June before mining operations are in full swing, and it will require this summer and next before the value of the Porcupine as a placer mining region will be known.

ARIZONA.

Prescott *Miner*: The Harlan mill on Turkey creek closed down on account of a scarcity of water. Mr. Harlan is putting in a pipe line 2400 feet to a spring, which, when completed and added to his present supply, will furnish enough to run continuously.——Mr. Taft has encountered a supply of water in his Sterling property on Big Bug. Between the water from the Sterling and that from the Lottie tunnel there is a large flow in Big Bug creek.——The Garcia G. M. Co., owner of the Garcia mine on the Hassayampa, near Wickenburg, which closed down for several months, resumed work and has a large force engaged in developing the property.——The Ardath M. & M. Co. have men at work erecting a mill and hoisting works on their Oriole mine at Santa Domingo mountain, near Wickenburg.——Mr. Cleveland, who has a lease and bond on the Cumberland mine, owned by T. Roach and others in Pine Flat, recently struck a body of ore 32 inches wide at a depth of 160 feet. This mine shows several shoots of ore. He has eight men at work developing it.——The company which purchased the Buster group in Pine Creek district has ten men at work building a road to the property. Mr. Hooper is in the East on business connected with the property, among other things to buy a mill. The mine is opened by two tunnels, in which there is a continuous ore body 900 feet in length. The company will run another tunnel, starting near the gulch, and connection with the upper workings will be made by upraises, and the ore will pass through it to the mill.——The Mohawk group, owned by ex-Supervisor T. Roach, adjoins the Buster group and is promising. A strike was made last week in a drift being run at a depth of 100 feet, where an ore body 4 feet wide was encountered. The ore averages $15 per ton.——Watts & Hanger also have a claim in the same district which they are developing.

Yuma *Sun*: G. Miles and F. O'Brien have gone to the Copper Mountain country, where they begin development work on a ledge of copper.——The Arizona C. & G. M. Co. of Phœnix, whose mines are in the eastern portion of Yuma county, near the Maricopa line, have made arrangements with Eastern capitalists for reduction works on their property.——Reports come from the Santa Maria district, in the extreme northeastern corner of Yuma county, that several copper strikes have been made.——C. E. Eichelberger has returned from a trip to the King district, where he has men at work on a prospect. The discovery of water in that vicinity has stimulated prospecting.——Water has been struck at a depth of 1000 feet within four miles of the King of Arizona mine. The company is erecting a mill and cyanide plant. The well will be sunk 100 feet deeper. There are several tons of ore on the dump and the force of miners is being increased.

CALIFORNIA.

Amador.

The Bunker Hill and Mayflower mines near Amador City have been sold at public auction. The sale was ordered by J. F. Aldrich, receiver of the Spring Garden National Bank of Philadelphia, Pa. The property is an asset of the bank, which was mortgaged for $200,000. The sale was ordered by the District Court of Philadelphia. The bidding was opened by C. R. Downs of Sutter Creek, Cal., who bid $21,000 for the property. The only other bidder was a Mr. Cheney of Philadelphia, who added $100 to the offers of Downs until the price reached $30,500, at which price Downs took the property. Downs is associated with W. F. Detert of Jackson; W. J. McGee, a local attorney, and State Senator Voorheis.

The Lincoln shaft at Sutter Creek is down 1000 feet.

The three-compartment vertical shaft at the Wildman-Mahoney is down below 500. Power drills will be put in as soon as the machinery arrives from the East.

The Kennedy M. Co. has appealed from the decision of Judge Nicol of Tuolumne county, in the case of the Argonaut M. Co. vs. Kennedy M. Co.

Supt. D. Fisher of the Hobart M. Co., operating the Spagnoli mine at Wieland, reports the shaft down 81 feet and sinking. It is the intention to erect a 10-stamp mill.

Butte.

Oroville *Register*: The Enterprise mines are busy, the owners taking out considerable gold.——The Gem gives employment to a number of men.——At the Golden Trout new machinery is being put in.——At the Slater mine good ore is being crushed. At the Crystal Peak a 200-foot upraise is being made.

Calaveras.

Several tons of quartz crystals and a large amount of agatized wood have been taken from the Green Mountain gravel mine, in Chile gulch. The crystals are of various sizes, some weighing over 100 pounds.

The Hobart Estate Co. and the Utica M. Co. are finishing their new electric plant near Murphys. The building has been built of lava from Table Mountain ranch. Its walls are 3 feet in thickness. The water power is expected to maintain a minimum of 2500 H. P., 1000 of which will be needed at the Utica mines and mills, which are again running.

The Angels mine has been cleaned up and placed in working order, the hoist and other machinery renovated under the direction of its owner, J. V. Coleman of San Francisco. As soon as a 20-stamp mill has been erected, work will be resumed on this property.

The new addition to the Gwin mill is provided with concrete foundations for the mortar blocks which are 14 feet in length. An air hoist has been put in on the 1400 level. The hoist is secured to a car and can be moved from place to place as required.

Mokelumne Hill *Chronicle:* It is reported that preparations are being made to resume operations at the Esperanza mine near Mokelumne Hill. The mill is to be increased to eighty stamps, a new hoist is to be erected and the shaft is to be sunk an additional 500 feet.

Angels *Echo*: The Bruner mine, two miles south of Angels, employs twenty-five men.——The Harris mine, one mile south of Angels, is to be operated on a more extensive scale than heretofore.——A 20-stamp mill is to be erected on the Angels mine.——Grading for the 120-stamp mill at Robinson's Ferry goes steadily on. This mill when completed will be the largest in the State.

El Dorado.

Placerville *Democrat*: One hundred men are employed at the Griffith.——A number of pockets are reported to have been taken out in the Kelsey district the past month.——Owners of the Ida Livingston, Kelsey district, have resumed operations, with J. Kelley Supt. A new shaft is down 50 feet.——T. Smith and P. Stingle have leased the Delmatia mine and are cleaning out tunnel and winze.——Roberts & McGraw have struck good prospects in their quartz mine in the Kelsey district, and are having a crushing made at the Ranney & Smith mill.——The Gopher-Boulder has installed new machinery, preparatory to resuming crushing.——The citizens of Georgetown have established a local mining district, with the boundaries as they were previous to the act of March 27, 1897.——J. S. Blackiston has bonded his Crystal mine at White Rock to A. S. Moore of San Francisco for sixty days. The mine is to be prospected for quartz crystals and gold.

Kern.

Six mills are in operation in the Randsburg district.

A run of ninety-five tons of ore from the Winnie mine, Randsburg, made at the Barstow mill, yielded $887, being the second run from that mine milled at Barstow. The first, of forty tons, made two weeks ago, gave $538.

The owners of the asbestos mine near Bakersfield are reported to have an offer from New York for the entire output.

The Wedge mine, Randsburg, has had a run of thirty tons of ore at the Red Dog mill which yielded $2500, averaging $80 per ton.

Mono.

Bridgeport *Chronicle-Union*: C. H. Glines and J. Hays, owners in the Arnot and Par Value mine on Green creek, are at the property getting the mine and surroundings ready for working this summer.

Nevada.

It is reported that a new shoot of ore has been struck at the Pittsburg mine on Gold Flat, near Nevada City. The mill will be put in repair and started up.

The North Star Mines Co. of New Jersey is a successor to the North Star M. Co. The North Star Mines Co. is capitalized for $5,000,000, or 500,000 shares, par value $10. J. D. Hague is president; W. L. Bull, vice-president; W. D. Pagan, Secretary. The directors include the foregoing, with A. G. Agnew and Benjamin Strong, all of New York. C. G. White of Boston will be added to the board. President J. D. Hague says: "The old North Star M. Co. has been operating for years in the Grass Valley mining district and acquired the North Star mine, which had up to that time produced $3,000,000 gold. The company reopened the mine, it having been idle, and it has since produced $2,500,000. The company has been acquiring additional property adjacent to the North Star, which in times past had been productive, in this way acquiring two or three large mines and a number of adjacent mining claims which have been consolidated and conveyed to the North Star Mines Co., the new company which will develop at great depth the combined property comprising the North Star mines, the New York Hill and the Massachusetts Hill or Stockbridge mine. These three mines have produced in the aggregate $12,000,000 to $15,000,000 and are now to be opened at greater depth. The Massachusetts Hill mine has produced within the last two years $800,000, nearly all of which came out of ground purchased for $30,000 to $40,000. The new company is in productive condition, taking out $30,000 to $40,000 per month, and has paid two dividends of $50,000 each since November."

Tidings-Telegraph: Moroney, Webb & Baldwin, who are interested in the Slide mine, at French Corral, have ordered a mill for their claim. The new mill will have a capacity of fifty tons a day. A Bartlett concentrator will be put in.

Placer.

T. Haney is working six men at Bloody ravine.

B. Kavanaugh is taking out pay from his mine near Bald mountain.

S. Savage has put up hoisting works at the Savage mine and is prospecting.

The shaft at the Whisky Hill copper mine is down 135 feet. Cuts have been run, opening up 1200 feet of the ledge. The rock yields 9% copper, $3 in silver and $5 gold per ton.

J. McAninch, G. Cowan, E. B. Quigley and J. Shiels have bonded the Glen Consolidated mine in Duncan canyon to a Colorado company.

Riverside.

In the Virginia Dale district a scarcity of water has obliged several of the mills to suspend operations. The water supply is derived from wells sunk in a dry lake basin north of the mines. The O. K. and Arbois are operated steadily, but several mines are shut down.

Los Angeles *Herald*: It is reported from San Diego that an effort will be made to work the lepidolite mines near Pala. An agreement has been filed in the recorder's office at San Diego whereby N. G. Douglas and other owners of the mines agreed to supply W. J. Schieffiln, a New York druggist, with as much lepidolite as he might want, up to 1200 tons a year, at $40 a ton. The agreement stipulates that none of the mineral shall be sold to anyone else for five years. This mineral is a lithia mica and contains handsome crystals of pink tourmaline (rubellite) in radiated groups.

San Bernardino.

Yuma *Sun*: G. Livingston and H. Randolph have gone to gold mines twenty miles from the river above Ehrenburg in California on which they will do development work. They have a ledge of free gold.

The Rose mine on the San Bernardino range, fifty-five miles easterly from Victor, is running, but there is a scarcity of water.

San Diego.

Lepidolite, with tourmaline, occurs near Mesa Grande in large granitic veins, not far from the Indian rancheria.

It is reported that a discovery of gold-bearing quartz has been made on the Warner ranch northwest of Julian.

Yuma *Sun*: There are eighteen men using dry washers and rockers in the Potholes district, twelve miles above Yuma, with good result. W. Boyle and partner, Mr. Riley, exhibited $22.10 in coarse gold which they took out of seven yards of dirt. The richest gravel is on the banks of the river under 2 feet of dirt which they strip, as it does not carry enough value to pay working in a rocker. It is impossible to reach bedrock, owing to the volume of water. This district has been producing gold for thirty years, but has never been systematically operated, the rocker and dry washer being the only methods used.

Shasta.

(Special Correspondence).—Near Igo J. P. Wright, who has been developing a silver property for a number of years, has found a 20-inch ledge, from which he made a shipment of several tons to the Selby Smelting Works. The returns were 500 ounces silver per ton.

H. Christensen is developing his claims near Igo, taking out a fair grade of smelting ore.

Price & Wartechek, on Muletown, are making their first shipment. They began work on their property two months ago. They haul their ore ten miles to the smelter.

There is a probability that the Afterthought copper mines will resume work. The property has been idle a number of years. They are twenty miles east of Redding.

F. Hurst has four men developing the Dobrowsky claims near Shasta. He made two twenty-ton shipments four miles by wagon to the smelter, and received $14.72 per ton on one and over $20 on the other lot.

The Mt. Shasta mine is pushing development work to 500 feet depth and employing eighty men. In consequence of development only five tons of ore per day are hauled to the smelter.

M. T. Howell & Co. are making a second twenty-ton haul to the smelter at Keswick.

Near Copley a group of thirty copper claims belonging to Ellis, Murray & Co. are being developed under bond.

Shasta, June 12th, '99.

Four hundred men employed by the Mountain Copper Co. at their mines at Iron mountain struck on the 13th inst., the result of a demand for increased wages. Last week the company raised the wages of 500 men at their smelters at Keswick 10% to 15%. Sunday a committee of miners at Iron Mountain demanded an increase. The quarrymen receive $1.60 a day, muckers $2.10 and miners $2.60. The committee asked an increase of 40 cents a day for each. The company was allowed until June 15th to announce its decision. On the morning of the 13th several of the men known to have led the demand for greater wages were discharged. The 400 at noon quit work and marched to the office and demanded their time. Enough ore is in the roasters to keep the smelters busy for a month.

Redding *Free Press*: It is reported that an agreement to purchase the Lowdon-Friday has been made by the Uncle Sam G. M. Co.—virtually a consolidation of the two properties in the Backbone district. The option is given until January 1, 1900. The consideration is withheld. The property of Lowden & Friday, known as the Cleveland Consolidated group, consisting of eight claims, adjoins the Uncle Sam. From the mines to a proposed smelter is a mile. From the smelter site to the railroad is three-quarters of a mile.

Redding *Searchlight*: H. C. Woodrow of Salt Lake, who has a bond on the Trinity group of gold mines at the head of Dog creek, six miles from Delta, reports that he will put three shifts to work on a mine of the group. He will sink a shaft 200 feet and drift under the ore body. There is now a 10-stamp mill and an electric plant on the property. A steam hoist will be put in.——C. D. Galvin and F. Grotefend are developing the King Copper property, three miles from Copley. Twenty-two men are employed in seven tunnels. It is thought the ore body will soon be reached.

Sierra.

The Plumbago mine, on the north side of the Middle Yuba river a few miles from Forest City, has been worked in a superficial way for years, and at times produced rich ore. C. Hegarty, Sr., of Moore's Flat, Nevada county, sold it to New York capitalists, and M. W. Mather was sent to take charge. Mr. Mather abandoned the shafts which had been sunk near the top of the ridge, and on the hillside ran three tunnels into the hill. Two of these are half a mile in length, and a fourth is contemplated which will have 1700 feet vertical depth from the top of the ridge. The tunnels were run on the ledge, which varies in size from a few inches to 5 feet in thickness. A 10-stamp mill is running night and day on ore. Bunches and pockets of rich ore are occasionally found.

Siskiyou.

Yreka *Journal*: The hoisting and pumping machinery for the new company to work the Nebrbass and Rostel grounds, adjoining the Blue Gravel mine at Greenhorn, will soon be working. Mr. Stevenson, who is to superintend the operations, has arrived in Yreka, and F. D. Fraser, who bonded the property, also returned.——Johnson & Kelly, who are mining old ground in the Greenhorn Blue Gravel mine on commission, are said to be getting pay from the present working. They do the timbering, hoisting gravel and sluicing at their own expense and pay 10%.——C. Fairchild has started his mill on Humbug, near Sucker creek, and finds good pay in the quartz. He has a 14-inch ledge and is close to the Thresh & Coulson ledge.——Mining is soon to be commenced in Yreka creek, in the vicinity of Hawkinsville, by the company which bonded the creek from Shasta river to the McNulty place near Yreka.——T. Austin & Co., working deep diggings north of the high school grounds, continue to find the average pay gravel.——Work at the Cherry Hill quartz mine on Cherry creek is carried on with success. It is the intention to run a 1500-foot tunnel towards the ledge 1000 feet below the surface, a survey having been made for that purpose.——J. C. Burgess is prospecting the ground at Cottonwood creek, near Henley and Hornbrook, for the company having a bond on same.

Yreka *News*: L. Erickson has out ore for crushing.——The Gold Ball and Aromas mines are working to their full capacity.——The Salmon River Co. is running with a large force.——Mr. Peterson of Eddys gulch cleaned up twenty-six ounces from a short run in his placer claim.——Peters Bros. have a ledge on White's gulch.——The Jumbo mine is reported to be bonded to Colorado parties.——The Gold Run is working twenty-two men.——The Knownothing has large bodies of ore and employs fifteen men.

Trinity.

The Morning Star mine, on Coffee creek, owned by Frue & Norton, is to put in power drills. There are two shafts—one 70 feet, the other 57 feet—and 310 feet of tunnel.

F. L. Dimock of Trinity Center has opened a copper ledge three miles above Trinity Center. There are two claims—Happy Day and June Day. A small cropping a few feet underground developed into a copper ledge 3 feet in width.

Redding *Searchlight*: T. J. Loftus recently discovered a ledge between porphyry and serpentine walls 100 yards west of the trail from the Nash mine store to the Keating mine. He has located a claim.——W. R. Conant is doing development work on his claim on Deacon creek.——H. Z. Osborn, formerly editor and proprietor of the Los Angeles *Express*, and M. H. MacIlvane, manager of the Nash mine store, have bought the one-half interest of J. Murphy in the Forest Queen mine and are running a tunnel which is expected to cut the ledge at 65 feet.——D. Donovan has located a claim on the Calahan trail near the Nash mine, one mile from the mouth of Hickory creek.——W. Maitland, Supt. Nash mine, has bought a copper prospect from C. J. Farmer. The claim is on Ram's Horn gulch, and, in addition to copper, shows gold and silver.——Ten men are employed at the Nash mine. The company is getting in such a shape as to work to advantage next year.

Tulare.

Porterville *Enterprise*: D. B. James, Supt. Minnie-Ellen mine, on Deer creek, reports finding ore in a vein 7 feet wide in one of the drifts. In the main vein they are in 30 feet of ore and still crosscutting. They have ore 90 feet wide in some veins. There are 3000 tons of ore on the dump.

Tuolumne.

The Tuolumne Mother Lode & Development Co. of Fresno has bonded the Columbus mine, which is a part of its property in this county, to San Francisco capitalists for $20,000. The Mother Lode Co. also owns the Big Oak group. This sale would give them $5000 for sinking on these mines, and the balance of $15,000 will go to stockholders as dividends.

Jamestown *Magnet*: Four claims on Whisky hill below Jamestown, known as Trio properties, have been incorporated under the laws of Wyoming, to be known as the Harvard G. M. Co., with a capital of 200,000 shares at $5 each. The claims included are the Trio, Mooney, McCann and Clark. The Erin-go-Bragh and Cloudman at Stent remain in the hands of the Trio trustees. It is reported a mill will be built.

Carters *New Era*: The Missing Link, adjoining the Buchanan, south of Carters, is being prospected by open cuts. A 6-foot vein has been found.——At the Buchanan a two-compartment shaft is being sunk which is down 650 feet. The company, it is reported, will put in an electric plant on the Tuolumne river. The mine has a 20-stamp mill and chlorination works.——The hoist, pump, buildings, etc., of the Junction mine, near Soulsbyville, have been transferred to the Laurel mines, near Arrastraville, owned by the Laurel G. M. Co. Eight men are employed at the mine.——The Chaparral, one of the pioneer claims of the east belt, is opened by two tunnels to a depth of 200 feet on a vein 2 to 7 feet

in width. The mine is being operated by Judge Lindsey of Columbia.

COLORADO.

The Argo smelter, at Denver, has complied with the eight-hour law and is running. The Guggenheim smelter at Pueblo is running. The closed works are under guard. At Central City men in the stamp mills are expected to strike. The mines already closed are the Commodore, Amethyst, Bachelor, Bachelor No. 2 and Last Chance, at Creede district; the Calliope and Hagerty, at Ouray; the Caribbeau and Montezuma, near Ophir; the Iron Mask ond Black Iron, at Red Cliff; Smuggler, at Aspen. The Porter Fuel Co., at Durango, employing 150 men, has also closed. At Leadville 900 men have been discharged. Little except development work is going on. Four mines of the Colorado Fuel & Iron Co.—three near Canyon City and one in Pitkin county—have been closed down.

BOULDER COUNTY.

A strike of silver ore has been made in the Belcher mine on Caribou hill in the 200-foot level; almost solid silver ore was found. Three shifts are sinking the main shaft and when this lift is completed the shaft will be down 300 feet. Shipments are being made.

CLEAR CREEK COUNTY.

Georgetown *Courier*: By accident Mr. Anderson has located a new body of mineral in the 850 level of the Aliunde mine.——A mill-run of ore from the Onie Bell returned four ounces gold and fifty ounces silver to the ton. ——Another tin discovery is reported in Clear Creek county.——A raise is under way on the Comet mine, Silver mountain, to connect with the old shaft. When the connection is made daily shipments are expected.——The Atlantic Milling Co. has entered into a contract with the Enterprise Tunnel Co. at Empire to do their concentrating. The output of the mine is now twenty tons per day, which will be increased.——H. Kneisel and others are developing a group of lodes on Democrat mountain. They have driven a tunnel 700 feet and within another 100 feet expect to reach a junction of lodes.

GILPIN COUNTY.

A recent strike in the Whiting mine, on the 320 level, is in ore assaying $200 per ton. Shipments from this property average thirty tons per day.

Eighty-three cars of ore were shipped from Blackhawk the first week in June.

The Maine is to resume operations under Mgr. Brereton. The present 250-foot shaft is to be sunk 100 feet deeper.

A new 25-stamp mill is to be built in Fourmile gulch, near the Rocky mountain concentrator, to be under the same management as the latter. It will be 33⅓x50¾ feet on the ground, of the slow-drop type.

Central City *Register-Call*: In May there were treated at the Rocky Mountain Concentrator in Black Hawk, 1250 tons of ore which produced 395 tons of concentrates. Mgr. J. Hannigan says A. L. Collins intends to put up a 25-stamp mill on the site of the offices at the rear of the concentrator. The mill will have twenty-five slow drop stamps weighing 700 pounds each and dropping thirty-five times to the minute.

GUNNISON COUNTY.

(Special Correspondence).—R. W. Spensley, formerly of Leadville. has gone to resume work on the Union Park placer property, which is near the Watson or Taylor Park placer. He is putting in a bedrock flume, which will have a length of 4000 feet and is 3¼x3¼ feet. The company have already in 1600 feet of flume besides the one now building. Thirty men will be employed this season.

The Mgr. of the Watson placer is also on the ground and will start work. They will soon begin using the giants. It gives employment to fifty men.

Work has been resumed on the Maple Leaf property, on Cochetopa creek. The shaft will be sunk 100 feet farther and drifts and crosscuts will be run. The shaft is now 50 feet deep. Some rich ore has been shipped from it in the past.

At the Tuller & Riley property considerable development work had been done during the latter part of the winter, which has produced seventy-five tons of ore that will pay to ship. The vein is 8 to 20 inches wide and is in a dyke which cuts the schist formation nearly at right angles. The vein has been exposed by open cuts and shafts for 2000 feet, and in all these places free gold can be seen in the quartz. There is also tellurium in the rock. An offer of $40,000 has been made for this property by outsiders, but the owners demand a higher price; a deal is expected at a compromise price. The property is well situated for milling purposes, as it is thirty rods from Beaver creek, where power can be generated for all purposes.

It is rumored that the ore from the Diamond K did not run as well as expected, and work may not be resumed.

It is understood the Daniel Dorondo is under option to Denver people.

Ross & Breden report a rich strike on the Iron Cap hill. The rock is jasperized quartz and gold can be seen with the naked eve.

Work is steadily progressing at the Venable but all information is being suppressed at present for some cause.

The Underhill M. Co. have put a force of men on their three claims, west of the village of Spencer.

J. Dunbar is doing assessment work on a group of eight claims near the Iron Cap property.

The deal has fallen through on the Iron Cap mine.

The Vulcan mine has again started and they are filling the mine with miners as fast as they can secure good men. None of the strikers are being put on the force. The mine will again take rank among the foremost in the county.

The first car of ore from the Midland under its present management has been sent to the smelters. If it proves satisfactory many more will follow.

Mr. Johnson, the principal owner of the Branch mine, has put on a whim and is sinking. The shaft is 60 feet deep. This property is a copper prospect. The vein is 3 feet wide at 50 feet and will run 25% copper and some gold. The ore is principally red oxide. There are a number of other prospects near the Vulcan that show good values in copper.

It is reported the Standard and Sterling properties, on Cochetopa creek, are to be started. These mines produce milling ore which may be suitable to cyanide treatment. The vein is 3 to 7 feet wide and runs $10 per ton.

J. P. Smith has secured an option on the Keystone group through G. W. Bartholemew. He expects to open the property and ship ore. The property has large bodies of galena ore, which also carries silver, copper and gold. The vein is 15 feet wide; 2 feet of it will pay to ship without sorting, and the balance is a good concentrating ore. The property is developed by two tunnels, each 700 feet long. A number of other veins are found within the limits of the claims, but have had little development. The property is favorably located, both as to railroad and water power, being half a mile to each. The price to be paid is somewhat less than $50,000.

J. A. Goodwin is in Boston trying to float a property from this county with a good prospect for success.

Gunnison, June 10th, '99.

HINSDALE COUNTY.

The Lellie, seven miles from Lake City, which has averaged a shipment of 3½ cars of ore per week for eighteen months, is to be equipped with new machinery, comprising hoist and compressor.

LAKE COUNTY.

(Special Correspondence).—It is estimated the section which holds the down-town mines at Leadville makes 2000 gallons of water per minute. To keep it unwatered five pumping plants are employed constantly, having a combined capacity much in excess of the present demand upon them.

The Weldon, one of the down-town groups, is operating its two principal shafts and will soon be producing, as formerly, 150 tons of lead-carbonate ore per day. Mgr. T. S. Schlessinger states that the force of thirty men will be increased.

The Neubian M. Co., also under the management of Mr. Schlessinger, is preparing to sink a shaft on a forty-acre tract which they control in the down-town district.

Leadville, June 7th, '99. WASCOTT.

The Comstock Mining and Leasing Co. has secured five well located claims near the Antioch, with a territory of fifty acres. These claims include the Amelia, Prince Albert, Comstock Nos. 1 and 2 and Thunderbolt. The new company will put down a shaft 800 feet. The officers of the company are A. W. Lawrence of Boston, Pres.; G. Flint of Boston, Sec'y and Treas.; R. B. Estey of Leadville, Gen. Mgr. One of the new shafts sinking on the Alhambra placer of the Revenue Co. will be sent down 600 feet. A second shaft has been started on another part of the ground and a third shaft will be started. The Revenue people have 140 acres of ground in their combination, which lies between California and Iowa gulches, and is about a mile east of south of the city. The officers of the Revenue Co. are R. C. Surbridge of Boston, Pres.; G. M. Steer of Boston, Sec'y and Treas.; R. B. Estey of Leadville, Mgr.

The President mine on Breece hill has commenced shipping fifteen tons of gold ore daily, adding another to the list of producers of the gold belt.

The Louisville mine, owned by D. H. Moffat, is now a producer of zinc ores as well as oxide and sulphide ores carrying gold, silver and lead. Zinc is being broken for the zinc mill in California gulch.

MINERAL COUNTY.

(Special Correspondence).—The owners of the Amethyst resumed management of that property on June 1st, at the expiration of Carver & Miller's lease.

The Commodore maintains its shipment of 400 tons per day.

The Happy Thought mine has been pumped out down to the seventh level, giving access to ore blocked out on that level. Part of this ore is concentrated at the Happy Thought mill and the balance shipped to the smelters.

Creede, June 12th, '99.

MONTROSE COUNTY.

The La Sal mountains, near the boundary line of Colorado and Utah, promise to be the scene of active prospecting and development during the coming season.

The sandstone surrounding the La Sal range extends entirely around the mountains, and everywhere is more or less impregnated with copper. The circle commences at La Sal creek, on the Colorado side of the range, where the Paradox mine is located. The ore is found again in the Big Indian mine, on the south slope, then in the Salt Wash district, on the west end, then in the Welsh and Huntsman, on the north, and from there the line is traced back to the Paradox, the distance being about 200 miles.

The Salt Wash district has been examined by T. L. Darby, who says that it is not likely to prove valuable, but other mines have opened into bodies of ore and are being developed. The Huntsman group of three full claims has been sold for $30,000 and the owners are putting the property in shape. The company will ship forty tons of ore to Salt Lake City.

R. Dillon has located a tunnel. The tunnel will reach a vertical depth of 1500 feet from the apex of the mountain.

A number of low-grade gold prospects have been found in the vicinity of Miners' basin and a company has been organized to build reduction works. Chicago people have bought the Mazeppa mines in Beaver basin and are considering the building of cyanide works.

OURAY COUNTY.

Sunday the Wedge M. Co., at Ouray, posted a notice informing the employes that the miners would go down the shaft on the company's time and come up on their own time, and take one hour for dinner. This action was not in accordance with the eight-hour law, according to the miners' views. The mine was closed down and the men paid off.

One hundred cars of ore were shipped from Ouray in May.

The force of men on the Revenue mine is larger than it was last year.

The Atlas, on Bear creek, is proving a success and working with increased force.

PARK COUNTY.

It is reported at Colorado Springs that the Green Mountain M. Co. has sold its thirty-two claims and 2500 acres of placers, patented, to the Calumet & Hecla M. Co. The property is located in Alma district and is undeveloped The Lee shaft is in a 5-foot vein of copper and iron pyrites. The mines are equipped with machinery, and two mills are in operation.

SAN JUAN COUNTY.

(Special Correspondence).—On the 9th inst. B. W. Sweet of Denver secured a contract to erect a 50-ton concentration mill at Gladstone, near Silverton, for the Red Mountain & Bonita G. M. Co., of which Dr. C. A. W. Zimmerman is Gen. Mgr. and whose home office is at Quincy, Ill. The mill will comprise stamps, rolls and concentrators. The Gates Iron Works are to furnish the machinery.

Denver, June 9th, '99. WASCOTT.

The Silver Queen is being developed by its owners, most of whom are residents of Kearney, Neb. It is to be further equipped with machinery. The development is mostly tunnel work at different levels on the vein. The ore is smelting and of a grade to stand shipment. It is claimed ores of the value of $30,000 have been shipped.

SAN MIGUEL COUNTY.

Denver *Republican*: Shipments for May from the Ophir district show an increase. The last week was the heaviest of the month, the total being thirteen cars—four cars of concentrates from the Caribbeau, four cars of ore from the San Bernardo, one from the American Frenchman, one from the Montezuma, two from the Butterfly and one from the Alta.

SUMMIT COUNTY.

The Hamilton mine and mill, in Summit gulch, are expected to start up in a few days. Concentrates, accumulated during latter part of winter, are being shipped.

TELLER COUNTY.

(Special Correspondence).—The Work properties on Raven and Gold hills are worked by sixteen sets of lessees. The gross receipts from sale of ore for the year ending June 1, was $46,102.

The output of the Orpha May on Bull hill was 750 tons of ore for the month of May, averaging four ounces gold to the ton.

A recent shipment of ten tons of high-grade ore from the Last Dollar on Bull hill brought $1900 to the ton. This came from a newly opened body of ore containing a streak of quartz carrying fine gold and is below the sixth level.

The Isabella Co. has declared a dividend of 2 cents per share, amounting to $45,000, payable June 26th.

The National M. & L. Co. are preparing to develop a group of properties on the north slope of Tenderfoot hill. It is claimed this company paid $5000 for the group of twenty-one acres.

The Matoa G. M. Co., whose Matoa mine is on Gold hill, have purchased an adjoining property known as the Johnson lease, claimed to have produced $500,000. The purchasers will sink 200 feet to the 800 level.

Cripple Creek, June 11th, '99.

Denver *Republican*: A large quantity of mineral is being broken by two sets of lessees operating on the Pinnacle Co.'s ground, who recently made good strikes.——On the Lansing the lessees are getting the lease in better shape as regards equipment. In the breast of the drift run at the second level the ore body measured 5 feet.——The strike made on the Mitchell of the same company is holding out. The lessees are preparing a carload shipment to be sent out this week. There are ten tons in the bins. The find is supposed to be a new vein, the strike being toward the Lansing workings.

IDAHO.

J. Lefler, a prospector, reports a discovery in the Crooked river country, midway between Buffalo Hump and Salmon river.

Warner Bros. have 8 feet of lead, of which 5 feet is solid quartz and 3 feet granulated quartz which assays $45 and this has been stripped for 900 feet. The claim is named the Drum Lummon.

Smith & Blake have also made locations, their principal one being the Monday, parallel to the Drum Lummon on the west.

While water has been plentiful the Granite M. Co., has been ground sluicing its ledge east of the old works and uncovered it where it was 18 feet wide. In the old workings the ore is a high-grade gold ore, but base, the amount of free gold saved on the plates being small and concentrates run high enough to ship to the smelter. Where the vein was recently uncovered it is galena, the surface assaying 30% lead, $13.27 gold and two and one-half ounces silver, making ore worth $40 per ton.

The second payment of $25,000 on the bond of the Big Buffalo mine at Buffalo Hump is reported paid. Since the first payment a shaft has been sunk 60 feet. The Big Buffalo was purchased on a bond by Clark & Sweeney of Spokane, and it is understood to have been floated in New York.

There is excitement in the Boise basin country over the discovery of a rich gold ledge three miles west of Idaho City.

Placer gold is reported discovered on the St. Joe, near the mouth of Slate creek. The gold was found on a side gulch high above the creek, but at last reports bedrock had not been reached.

The Helena and Frisco mines at Wallace have started up with twenty to twenty-five men each, under military protection.

Spokesman-Review: The Monte Cristo mine at Buffalo is working seven men, running three shifts of eight hours each. They are down 30 feet in the shaft, in ore, with neither wall in sight. The quartz from the shaft shows free gold.——The Saint Paul, adjoining the Monte Cristo, has had crosscutting on the surface and shows the same character of ore as the Monte Cristo. For 4500 feet the ledge shows a width of 6 to 10 feet on the surface. ——On the Big Buffalo workmen are crosscutting. It is said that the crosscut is in over 40 feet and the other wall not reached. ——F. Brown, constructor of the trail into camp, says the workmen are within thirteen miles of camp, and he thinks ten days more will see the work completed.

Boise *Statesman*: The DeLamar M. Co. is reported to have purchased the Big Buffalo mine for $500,000 on June 7, the first payment of $25,000 to be made July 15. This mine is the original discovery of the Buffalo Hump camp.

Salt Lake *Tribune*: At Salmon City, F. Ibach arrastraed ten tons of ore from the Kittie Burton on Indian creek, which turned out a bar weighing thirty ounces in gold, with ten ounces remaining in the crevices of the arrastra, which continues to run on the same class of ores. There are 18 inches on the foot wall that will average $75 per ton.——The representatives of New York parties who recently bought the Ulyssus group of Suydam & Ibach are letting contracts for a 5-stamp mill, etc., the machinery for which is at Red Rock station.

NEVADA.

Repairs to the hoisting engine at the C. & C. shaft in Virginia City have all been completed and work resumed in the Consolidated California & Virginia mine through the shaft. The first elevator will be raised, the defect located and remedied and the elevator again put at work. Meantime the second elevator keeps the water down, running eight hours out of twenty-four.

The New Pass M. Co. has shipped its first gold bullion from ore running $16 per ton.

The Dexter M. Co. of Tuscarora has sent over $5000 in bullion to Salt Lake.

De Lamar *Lode*: Searchlight lies between Manvel, San Bernardino county, Cal., and the Colorado river, being ten miles west of the latter and twenty-five miles northeast of Manvel, the terminus of the California Eastern railway. There is a good wagon road to the camp. There are 150 persons in Searchlight district, and twenty of the properties are working. Among those developing mines are F. W. Dunn, E. J. Coleman, F. C. Perew, B. Macready of Los Angeles, and Daugherty, Rose & Colton.——The New Years Gift and Searchlight are owned by the Searchlight M. Co. On the New Years Gift two shafts have been sunk 100 feet apart and connected at the bottom by drift. There is also a drift 30 feet east of the shaft and an upraise 50 feet. The shafts were sunk on the vein, and in sinking considerable ore was taken out and one carload shipped. On the Searchlight two shafts have been sunk, one 100 feet and the other 120 feet. They are parallel claims; the shafts were sunk 120 feet apart and on the vein. A drift will connect the shafts. The drifts were run in the wall and the ore left in place. All the ore extracted in sinking is on the dump with the exception of a few carloads shipped for test. The width of the vein is 4 feet and will average $23 in gold per ton. There are twelve men employed. Sinking will be continued as soon as air connections are made.——The Good Hope claim is owned by F. Colton. It has a shaft 100 feet deep on the vein, and in sinking several carloads taken out were shipped which averaged $125 in gold.——F. Perew has a number of claims upon which 300 feet have been sunk.——E. J. Coleman is down 50 feet on three of his claims and has a good showing.——B. Macready is opening the Golden Treasure and Copper King.——On the Copper King a shaft is down 100 feet and a 50-foot shaft on the Golden Treasure. These claims are parallel. They are drifting on the vein to connect the two shafts. The vein is 18 feet wide. In running a crosscut 50 feet two veins were encountered, one 4 feet and one 18 inches wide, each averaging $30 in gold per ton. A whim has been put up and ten men are employed. So far ore is piled on the dump until the best method of treatment is determined.——On the Goodenough and Rajah claims, owned by Boller and Lovey, two shafts have been sunk to a depth of 70 feet and both show ore.—— The Hopkins group of six claims is in charge of F. W. Dunn. The owners of this group are also part owners of the Copper King and New Years Gift. On the Pope there is a perpendicular shaft 100 feet deep which cuts four veins, the smallest of which is 14 inches, the largest 4 feet; from the bottom of this shaft a crosscut has been run to tap seven parallel veins which crop on the surface. On the Columbia a 50-foot shaft has been sunk and 30-foot drifts run on the vein. This vein, as well as other veins, runs northeast and southwest. The Columbia veins dip to the southeast, the Pope and Boston to the northwest. On the Columbia a double-compartment shaft is down 75 feet, timbered. Sinking will be continued. On the Boston a shaft on the vein has been sunk 220 feet, and at the 100-foot station drifts both ways have been run 300 feet, and at the 150-foot station drifts each way 125 feet. At 205 feet water was encountered and at this point a drift has been started to make connection with the double-compartment shaft, a distance of 150 feet. The crosscut is now in 80 feet and in this distance three veins have been passed through.

NEW MEXICO.

Santa Fe *New Mexican*: W. R. Doran and W. W. Fitzpatrick have opened a 4-foot vein

of fine looking copper ore in Lincoln county. ——Work at the Malaga coal mines has been suspended and the force removed to the Salado mines.——The claim holders of the Jicarilla mining district will put a stop to the illegal cutting of timber.——The Colorado Fuel & Iron Co. employs forty mules and sixty horses hauling ore from Hanover to Santa Rita.——H. C. Meyers made a gold discovery at Gold hill, near Lordsburg. Assays of the paystreak run six to fifteen ounces in gold. ——After two years of work the Catherine management has struck the rich Snake vein in Sierra county.——W. H. H. Llewellyn has given orders to resume work on the tunnel in Animas peak.——All the men on the Timber Peak mine and mill, with the exception of three, were laid off and work will not be resumed until the return of Mgr. R. H. Sanders from Philadelphia, where he is attending a meeting of the stockholders.——A gasoline engine and hoist have been put up at the Excelsior mine, Organ.——The Mormon mine near Organ has been bonded to Enock & Jewel of Kansas City.——J. C. Greenway of Pittsburg, Pa., has taken a bond and lease on a group of copper claims in the San Andreas mountains. He will put a force of men at work under T. Jones.——A 10-inch lead of galena has been struck on the left fork of Red river.——A. R. Manby of Taos has located a number of gold and copper claims in the Rio Arriba copper country.——The Abbott Bros., working the iron placers on Placer creek, are taking out gold in paying quantities.——Development work has commenced on the Grand View on the Columbine. The property carries lead and gold.——The Whale mine, recently sold to Montana parties, is shipping gold and copper ore and prospectors are making new locations and starting development. ——The Mystic, on the west side of Baldy, in Colfax county, has been bonded to Indiana parties for $40,000.— Prospectors near Sweet Water have discovered a lead of quartz cropping near an inclined bed of copper-bearing shale.——J. G. Schuman of Santa Fe has bought one-half of the interest in the Texas Girl, near Bland, from T. B. Ward. He has also bought the Padre lode from M. Hill.—— Much of the ore taken from the Montoya mine, Santa Rita, runs 75% copper.——Burns & Spafford have leased the Romero Extension mine at Santa Rita, Grant county, and have sunk a 100-foot shaft. They employ fifteen men.——Bible, Halleck, Jay & Co. have sunk a new shaft which taps the old Spanish workings on the Carrasco mine at Santa Rita. They found a nugget of copper weighing 1500 pounds.——Bragaw & Potter are working the Modoc-McCarth group at Hanover, recently sold by A. W. Tenant of Santa Fe. On the Modoc a drift was started in the ore body. The returns at the smelter give 7% to 12% copper.

OREGON.

(Special Correspondence).—A number of mining men have been making an examination of the property of J. H. Searles, near Cornucopia. The property has a 20-stamp mill and comprises a group of fifty claims. The ore is concentrated and shipped to Tacoma. Concentrates are reported to run $225 per ton. The veins are from 2 to 10 feet wide.

The placer mines of J. Arthur are again being worked. The force will be increased as soon as the snow in a 30-inch sluice permits.

Cornucopia, June 4th, '99.

Sumpter *News*: Dr. J. J. Fisher and D. Copping of Sumpter have sold their Pine creek placer ground to H. E. Courtney and J. I. Sturgil of Baker City.——The Sloan & Haskell placers at Susanville are showing up well. As high as $85 to the pan has been taken out from bedrock, we are informed by Mr. Sloan.——J. M. Jones has sold his half interest in the Golden Treasure, the west extension of the Amazon, to S. Chapman of the Ibex for $4000. There are four parallel veins in the property, with a considerable development and necessary buildings. Assays will average $15, running as high as $40.——J. D. Young and P. G. Estes of Sumpter have sold their Gold Hill mine, an extension of the Mammoth, to J. A. Panting, Mgr. Burnt River M. Co. The consideration is $15,000, of which $5000 was paid down.——The Annalulu mine, situated on the same vein as the Mammoth and Amazon near Sumpter, was bonded by the owners—L. J. Hazlewood and Dr. G. W. Tape—to S. Chapman of the Ibex. The bond is for $15,000, payable in two years, with a cash payment of $1500. Dr. Tape purchased a one-fourth interest in the Annalulu last winter for $200.

Grant's Pass *Mining Journal*: The Channel hydraulic placer property and adjoining claims, comprising the Old Channel 60 acres, Booth 160 acres, Oregon 160 acres, Rialto 160 acres, Powelson 20 acres, Golden Link 60 acres and Rich gulch 40 acres, situated on Six Mile creek (a tributary of the Illinois river), thirty-two miles from Grant's Pass, has been sold to C. B. Beardsley, W. H. Thompson and others of Chicago. The owners were J. O. Booth, F. D. Burns and associates. It is an auriferous gravel deposit, occupying a high plateau 400 feet above the river, on which there is a frontage of more than two miles. The mine has been worked for years in a small way. The property will be equipped with modern hydraulic mining machinery, and Surveyors Wright and Perkins have made surveys for a ditch that will be 3½ miles long and give them a pressure of 300 to 350 feet with about 2000 inches of water.

SOUTH DAKOTA.

On the Dakota Maid M. Co.'s property of fifty-four acres large bodies of ore are opened up. The Dakota Maid has a 1000-foot tunnel and a 160-foot shaft with stopes at the bottom, besides numerous tunnels, pits and shallow workings on different parts of the location. When the west drift is extended 20 feet on the level of the 1000-foot tunnel it will tap the fissure at a vertical depth of 376 feet.

The Holy Smoke camp is two miles from Keystone. The Holy Smoke was located by J. A. Clark. The Golden Return M. Co., composed of H. F. Chipman, J. H. Duffie, H. Binswanger and E. G. Stevenson of Detroit and J. A. Clark, own the Holy Smoke and Vulcan, which originally included ten claims, to which have been added, by purchase, four adjoining claims. There are on the property five ledges, two of which have been opened. A shaft has been sunk on the Holy Smoke 150 feet and an ore body 40 feet wide encountered, assays from which return $3.10 to $24.80. It is free milling and concentrating ore. In the Vulcan shaft, 100 feet, ore was found a few feet from the surface and the shaft has continued in ore all the way down. The ore is copper and gold similar to the Holy Smoke and assays from $1.60 to $9 in free gold and $14 to $90 in concentrates. It is the intention of the company to equip the Vulcan shaft with a steam hoist, pumping plant and air compressors.

Deadwood *Independent*: Wolzmuth & Co., owners of the cyanide plant at Spearfish, and who have a lease on the Alameda property, near Portland, are shipping regularly to their plant in Spearfish.

UTAH.

The Jersey Blue group of mines at Bingham has been sold to Eastern people, it is reported, for $250,000. The purchasers include C. E. Graham and J. Kennedy of New Haven, Conn.; C. Burr of Middleton, Conn.; J. B. Collins of Chicago and I. S. Pine of Colorado. The vendors include Dr. J. K. W. Bracken, J. C. Dugan, C. H. Lashbrook, E. Rauch, J. Poudler and W. C. Hazelgrove of Bingham; F. L. Force of Charlotte, Mich., F. Pence of San Francisco; and O. Will of Salt Lake. The Jersey Blue group consists of the Jersey Blue claim, the I. X. L., Little Cottonwood, Big Giant, Elmore, Manila, Albatros, Harrison, Howard and Chandler, containing nearly 200 acres.

Salt Lake *Tribune*: At Castle Dale, from the work done, it is evident that the main body of mineral is confined to a blanket deposit, varying in width from a few inches to many feet, and extending from Green river to Hanksville on the east and from Castle Dale to the Fremont river on the west. In the center of this area is what is known as the San Rafael swell or reef. This reef is the result of volcanic disturbance, the formation being sandstone and lime. Porphyry has been injected into the overlying strata. The erosion of the crown of the uplift has left a jagged fringe of rock encircling the center of the disturbance. It is between the main body of the reef and what has been the overlying formation that the principal deposit of mineral-bearing rock is found, chiefly copper, carrying small quantities of gold and silver. The copper occurs in a layer of lime varying in thickness from a few feet to 24 feet, and encircling the reef a distance of 200 miles. The blanket, where it is exposed, dips from the reef at an angle of 45°, diminishing until it reaches its normal position of horizontal, where it attains an estimated depth of 3500 feet below the furface. Besides this blanket there are in the main reef fissures of more or less extent and width carrying values in copper and silver of a better grade than are found in the blanket.

WASHINGTON.

The Dear Trail No. 2 M. Co. paid a monthly dividend of $2500 June 15, making a total of $32,500 paid by the company from ore shipped in course of development, never exceeding four cars per month, and rarely more than two. The mine is in Cedar Canyon camp and produces high-grade silver ore.

J. Howard has located a group of copper bearing veins in the south half of the Colville reservation on Capital hill; he has a vein 10 feet wide carrying copper ore.

Galena and copper ore have been found in the Mable at Republic. The finding of galena ore is something new in Republic camp.

The mines of Republic camp are reported to have done development work during May which aggregates one mile of shaft and tunnel.

Spokesman-Review: The Morning Glory at Republic is to be developed to greater depth. A winze will be sunk from the tunnel on the ore shoot which was first opened in the shaft and later in the tunnel.——The North Star G. M. Co. has closed a deal for the purchase of a fractional claim which lies east of the North Star claim in Republic camp, which gives a tunnel site on the level of Granite creek, from which a tunnel can be run in 300 feet to tap the vein.

WYOMING.

T. F. Carroll of Fremont, Neb., is doing development work on the Shipper mine on Miner creek, four miles south of Grand Encampment.

FOREIGN.

AUSTRALIA.

Melbourne *Standard*: The Yankee Creek district, ten miles east of Bendigo, has for some time been prospected by private parties, and some promising shows have been opened. Slingo and party have had profitable results, a crushing going as high as four ounces to the load. The pioneer prospector, Mr. Greaves, sank a shaft 200 feet to water level and crushed stone which went 9¼ dwt. per load. Twelve months ago another shaft was sunk, 270 yards south of the original workings and a reef was cut 6 feet from the surface. The stone was 16 inches thick and was followed down on the eastern underlie 75 feet, varying in thickness from a few inches to 5 feet, averaging 3 feet. From this reef twenty-one loads have been crushed for seventy-five ounces, 19 dwt. Slingo and party have been successful. They are driving on 3 feet of stone, in which fine gold can be seen at a depth of 70 feet. A small battery in the district is needed as the stone crushed has to be carted to Bendigo or Ellesmere. —— The Inverell Diamond Field, Ltd., have plenty of water for all purposes. One hundred men are employed in the mine. The washing turns out rich both in diamonds and tin.——Elliott's Soldier's Hill property is running. His diamond and tin saving machine is working satisfactorily.——The Old Malacca, idle for some time, is starting again.——Kenzie & McCartney have bottomed their new shaft on wash, and the prospects of diamonds, gold, and tin are better than any they have had previously.——On the Borah Creek silver field, J. Howell has put in two tunnels and sunk two shafts on a rich silver mine. The ore is is a clean galena, going 70% lead, and at the present price of silver each ton of ore is said to be worth £22. This lode is 2 feet to 5 feet thick.

BRITISH COLUMBIA.

The Canadian Pacific extension from Rossland to Penticton, via Greenwood camp, is being pushed rapidly.

The parties interested in the Old Ironsides and Knob Hill groups at Greenwood have commenced the construction of their smelting plant. On these properties are large ledges of low-grade copper sulphides and iron, carrying gold values. The vein matter contains considerable lime. This camp is seven miles north of the Washington line.

Since the snow has about disappeared in Burnt Basin district there has been a renewal of activity in that section. The ores at first found were of the free milling sort, but more recent exploration has developed large deposits of sulphide ores. The Mother Lode is being developed. One vein of free milling ore on this property has been stripped for 200 feet and another of high-grade ore, 5 feet in width, has been uncovered. Another, showing 13% copper, has been stripped 1000 feet. The management will tap these ledges by running a 300-foot tunnel.

The Pleasure of Hope, owned by the St. George M. & D. Co., T. G. Elgie of Rossland Mgr., is being worked and the shaft is said to be in solid ore.

J. Hamill of Armstrong, B. C., and D. Graham visited the Basin to have some claims surveyed. They, with others, own the Barrow, Copper Farm and other properties. One of them was recently bonded for $20,000.

The Jackstraw, 1500 feet from the Mother Lode, owned by Hunter & Sharp of Rossland, has been worked and a ledge of free milling quartz uncovered. Free gold is visible to the naked eye in samples.

Williarson & Johnson have given a thirty-day option on the Big Chief group to a Montreal syndicate. These adjoin the Mystery group and have the same general formation.

Cowan & Hickman have commenced work on the Lucky Four, a group of claims situated on Boulder creek, seven miles from Trout lake.

J. W. Westfall, Supt. for the Old Gold & Primrose M. Co., will commence work on two of the company's properties with an increased force.

Morrison, McCord & Johnson have given an option for thirty days on the John L. group to J. Dixon of Vancouver. The value placed on the property is $20,000.

The Silver Belt group on Brown's creek, west of the south fork of Lardo river, on the Silver Cup ledge, will be worked this summer. The owners, H. H. Johnson and M. H. Dobie of Rossland and G. K. Morton, St. Thomas, Ont., will be associated with Eastern capitalists.

A strike has been made on the Merchant Townsend group, also known as the Downs group, above the Sunset property on Trout creek, near Index.

On the Capella group, Goat mountain, near New Denver, work is still in progress and high-grade ore is being taken out. A shipment of ninety sacks is being packed to the wharf.

Work is being pushed on the Hartney, Merrimac, Marion, Convention and Home Run, on Silver mountain, on all of which ore is showing.

Kaslo *Kootenaian*: A find was made last week by H. Mathews three miles from Duncan City on Howser lake. The formation is lime, believed to be a continuation of the lime formation on which the Bannockburn, Wagner, Gertrude and other claims are located. This is the first important discovery on the peninsula. Mathews states that the ore is $30 galena.

SOUTH AFRICA.

South African *Mining Journal*: The Schuller diamond mines are developing their No. 2 mine, ninety claims in extent. There are 20,000 loads of yellow ground on the floors, which will be ready for washing at the beginning of the month. There are 600 loads of blue on the floors weathering. The manager is sinking an incline to prove the northern boundary of the pipe. The opinion is held that these pipes, which occur in the Magaliesberg sandstone, will go down straight, and not like the pipes of other parts which crop out through shale and are funnel-shaped, tapering off to forty claims at 1000 feet depth. ——At the Wilgespruit, 660 feet to the north of the new reef, are found the Hospital Hill shales, much contorted, but unmistakable; the intervening space is occupied by beds of quartzite, with small bands of shale. On the footwall of the reef there is a thick bed of quartzite, and a thin band of shale separates this from the reef proper. This shale contains only a small quantity of gold. The reef itself is 3 feet in thickness and consists of altered quartzite. There are evidences of stratification, and the opinion is that the reef is one of the sedimentary beds of the Witwatersrand series. On the hanging wall of the reef there are 6 feet of quartzite and then shale; some distance south is another quartzite leader which pans gold on the outcrop. South of this are quartzites and shales, the latter predominating. Assays show at 22 feet, 3 feet of reef, 24 ozs. 17 dwts.; at 30 feet, 33 ozs. 6 dwts.; at 35 feet, 28 ozs. 4 dwts. The crossout is in some distance, and has not reached the reef; it may be broken and have to be found underneath. A fault having been met with in the crosscut indicates the latter probability. At the surface where the principal shaft is located the outcrop 8 feet gave 15 dwts.; 190 feet west another shaft is being sunk in shales north of the reef, and 300 feet farther west is another. On Weltevreden the outcrop has been located at two places, and in both instances the reef shows well. To the east, on Waterval, the reef has been located in the same relative position to the Hospital Hill shales and pannings obtained. The old reef worked ten years ago on Sayman's portion of Weltevreden lies half a mile to the south of the new line, and the prospectors claim that their strike is a new one, no systematic work ever having been done on it before.

Personal.

A. A. BLOW, M. E., was in Denver, Colo., on the 9th inst.

J. P. EVANS, of the Colorado Iron Works, is on a trip through the East.

W. B. WILSON, Supt. Elkton mine, at Cripple Creek, Colo., has returned from Scotland.

E. E. CHASE, M. E., Denver, Colo., was recently in Butte, Mont., on professional business.

C. D. LANE, Woodson Garrard and party, of Angels, Cal., left for Alaska in the yacht Townsend.

J. M. HANAUER, Mgr. Hanauer Smelter at Salt Lake City, Utah, was in Denver, Colo., on the 8th inst.

R. H. CHANNING JR. has taken charge of the Highland Boy at Bingham, Utah, in the capacity of Mgr.

A. E. LINDROOTH, Denver, Colo., representative of the Link-Belt Machinery Co., Chicago, Ill., recently made a trip to Arizona.

HORACE F. BROWN, who recently furnished the plans for the mill for the Economic Gold Extraction Co. at Victor, Colo., has gone to Chicago, Ill.

R. J. WALTER, Mgr. B. & M. mine at Ward, Boulder Co., Colo., recently made mine examinations in the Black Hills and Bradshaw mountains, Ariz.

F. G. FARISH has resigned his position with the Grand Central M. Co., Ltd., of Minas Prietas, Sonora, Mexico, to take charge of the Humboldt mine at Ouray, Colo.

N. MANSFIELD, who for nine years has been Supt. Smuggler-Union mine, at Telluride, Colo., has resigned his position, being succeeded by C. W. Miller, formerly of Aspen, Colo.

Recent Mining Incorporations.

Manhattan G. M. Co., San Francisco; capital stock, $250,000—subscribed; C. E. Hegard, C. A. Kroch, C. V. Hegard, H. Boldt, G. E. Dangle.

Royal Oil Co. of Coalinga, Fresno, Cal.; capital stock, $500,000; subscribed, $25,000; C. A. Canfield, J. A. Chanslor, W. Easton, G. D. Easton, L. Phipps.

Black Hill Oil Co., Fresno; capital stock, $250,000; subscribed $100,000; L. S. Chittenden, A. L. Hobbs, H. J. Pfluger, H. Nathan, W. B. Holland, A. B. Smith, F. J. H. Manning.

Stanislaus Dredging Co., San Francisco; capital stock, $25,000; subscribed $12,700; N. M. Stover, C. H. Shorey, Sonora; C. H. Cornell, F. P. Bull, San Francisco; S. Goodenough, Oakland.

The Turner Oil Co., Los Angeles; capital stock $30,000, subscribed $8000; M. W. Turner, H. C. Turner, F. C. Turner, G. W. Brookins, J. T. Kirkwood.

Hanford & Oleander Oil and Mineral Co., Hanford; capital stock $320,000, subscribed $160,000; R. J. Wilson, W. J. Wilson, C. A. Lauder, H. C. Lauder, B. L. Barney.

Dolly Varden M. Co., San Francisco; capital stock $1,000,000, subscribed $5000; P. W. Johnson, E. A. Barber, W. A. Sabin, A. L. Black, H. S. Wilson.

Commercial Paragraphs.

THE Colorado Iron Works reports a strong demand and large sale of Bartlett concentrators.

THE Dillon Iron Works of Denver are making several of the Woodbury Imperial concentrators for Colorado trade.

THE Jeanesville, Pa., Iron Works Co. have received an order from British Columbia for three of their compound mining pumps.

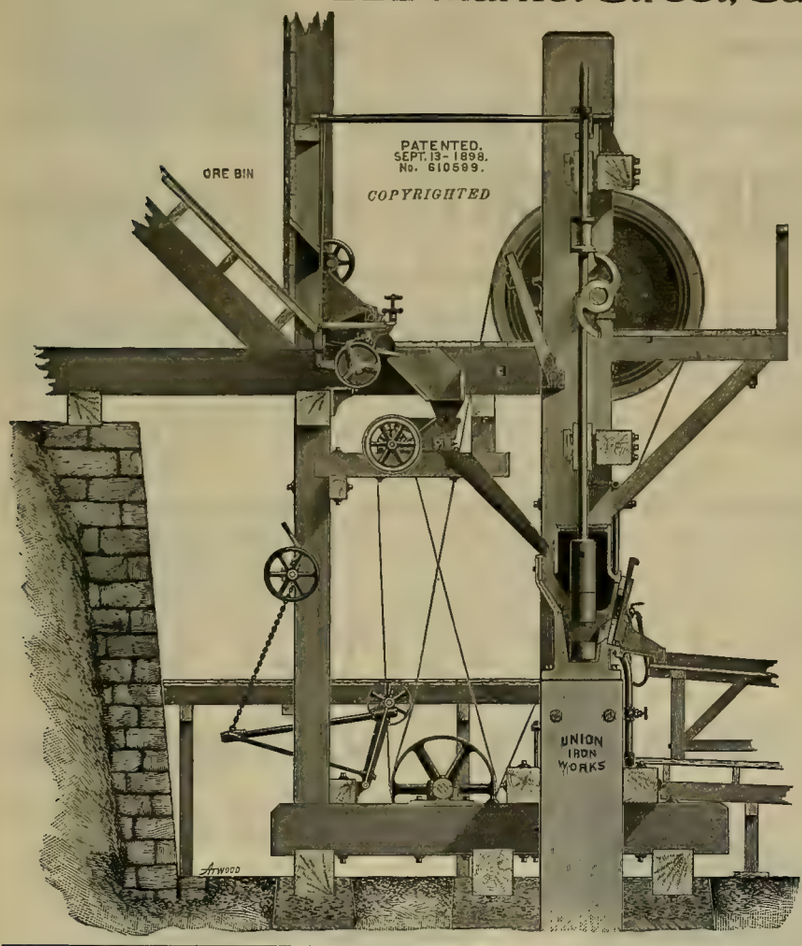
SKINNER & SETHMAN, Denver, Colo., agents for the Gates Iron Works, recently sent a Tremain stamp mill to a mine in Chihuahua, Mexico.

J. GEO. LEYNER, manufacturer of mining machinery, Denver, Colo., will soon move into his new shops at Thirty-sixth and Wazee streets, and into city offices in the Albany Hotel building.

THE Denver Engineering Works reports a heavy demand for Cammett concentrators, manufactured by them at the rate of thirty per month. Tables of this make were recently shipped to Breckinridge for the Mountain Pride mine and the Ault-Wilborg Co. They are building three 150 H. P. double drum electric hoists for the Le Roi mine at Rossland, B. C., and report fourteen sets of rolls in process of construction; also the building of a double 12x18 steam hoist, twenty-four special ore cars, six electric mine blowers and three electric incline hoists for points in State of Durango, Mexico. They have built a Loder pyritic smelter to be erected at Kokomo, Colo., and are building one of the same type, having a 200-ton furnace, for parties near Atlanta, Georgia. This kind of furnace, it is claimed, effects a great saving in fuel. They recently filled orders for three cars of water jackets for Colorado smelters.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.



THIS ILLUSTRATION

Shows our patent Improved Stamp Mill, with Secondary Crusher, which increases the capacity of the ordinary stamp battery from 25 to 30 per cent.

We respectfully invite the attention of those contemplating the erection of new mills to this practical improvement.

For particulars address

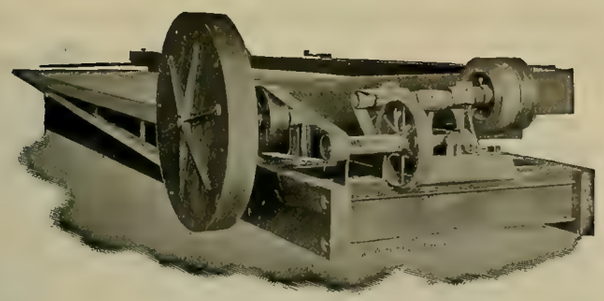
WILFLEY CONCENTRATOR.



The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HAY RAKE ATTACHMENT.—A. F. Martin, Chester, Cal. No. 626,434. Dated June 6, 1899. This invention is designed as an improvement upon spring tooth hay rakes and consists of one or more wire guards extending across the arc of the outer teeth of the rake which act to prevent the hay at the ends from falling or being dragged out. These wires have a certain portion of their length made elastic, and there are connections on the exterior teeth of the rake which form attachments for the ends of the wires, these connections being so disposed that the wires extend in an approximately vertical position from the upper part of the tooth to points adjacent to the ends. The spring of the teeth is thus not interfered with, but the wires prevent the hay from falling out at the ends.

TIRE BOLT WRENCH.—Thomas E. Stockford, Leesville, Cal.; one-half assigned to Chas. E. Stockford of Sulphur Creek. No. 626,446. Dated June 6, 1899. This invention is for the purpose of securing and removing the nuts upon tire and similar bolts. The nuts are screwed on very tightly after being driven through the tire and felly, and it is difficult to remove them when it is necessary to take off the tire. This wrench has a hollow head adapted to fit over the inner end of the bolt, an arm swiveled to the head carrying a screw at the outer end and turnable to adjust the screw in the line of direction with the bolt. The screw is adapted to press against the head of the bolt and lock it in place. A nut wrench is turnable within the hollow head and has a socket fitting the nut, the shaft of the socket being in line therewith, and a means for turning the shaft so as to transmit its motion to the nut wrench. These means consist of ratchet wheels fixed upon the shaft, pivoted pawls, the points of which engage with opposite sides of the ratchet, and a spring which engages the pawls with the ratchet. A transversely movable screw is so disposed as to alternately engage one of the pawls and lift the other out of engagement with the ratchet so that the apparatus will work equally well to turn the nuts on or off of the bolts.

SEEDER ATTACHMENT FOR GANG PLOWS.—James E. Beach, Routier, Cal. No. 626,453. Dated June 6, 1899. The object of this invention is to provide an attachment for gang plows which serves to deposit the seed after the plow has passed. It consists of a braced bar fixed to the plow frame and extending rearwardly therefrom. The seed box is supported upon the rear end of this bar and has connections by which it may be tilted thereon. The feed for the seed is driven by contact wheels which may be made to engage or disengage as may be desired, by the tilting of the seed box so as to bring these wheels into or out of contact.

WAVE POWER PUMPING APPARATUS.—J. E. and W. Armstrong, Santa Cruz, Cal. No. 626,452. Dated June 6, 1899. By means of this apparatus the force of the rising and falling water or swell acts to operate a pump or pumps. The arrangement consists of independent vertical wells, one of which has a direct connection with the sea, and within it is a guided float adapted to rise and fall by the action of the waves. A pump is fixed in the other well and connections are made between the float in the outer well and the pump plunger of the inner one. A supply pipe or passage connects the two chambers at a oint above the bottom, and is provided with an inwardly opening valve which supplies water to the inner chamber and prevents its escaping again. At the bottom of the chamber is another passage having an outwardly opening valve, and controlling gates so that the water which is contained in the inner well may at any time be used to flush out and clean it by opening the lower passages. The action of the waves upon the float in the outer chamber will cause it to rise and fall and the connection between it and the pump in the inner chamber will constantly actuate the latter and cause it to throw a steady stream of water which is conducted to any desired point by suitable pipes. The water thus stored may be used for power or other purposes.

HAND BRACE DRILL ATTACHMENT.—W. H. Ames, Watsonville, Cal. No. 626,474. Dated June 6, 1899. This invention relates to an attachment for the ordinary wood-boring, bit-holding stock or brace by which it is made capable of use in connection with a metal-boring bit. The boring brace has a drill clamp at the lower end, a screw-threaded sleeve enclosing the upper part of the clamp, and an interiorly screw-threaded extension fitting and movable upon the sleeve to increase or decrease its length. A flexible connection is made between the part to be drilled, and the attachment upon this extension by which the length of the flexible connection is adjusted. A ball-bearing casing fits in the upper part of the sleeve, one part bearing upon the upper end of the drill clamp and the other being supported within the sleeve and turnable therewith. A lever is fulcrumed to the brace in such a manner that it can be moved into line with arms which radiate from the upper end of the sleeve so that by contact of these arms with the lever the sleeve may be turned in unison with the movements of the brace and the yoke thus advanced.

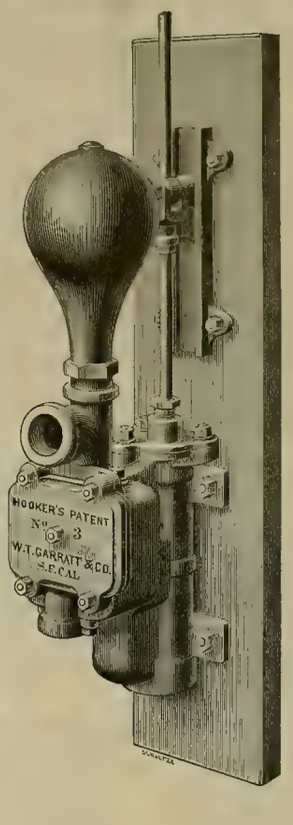
FILTER.—E. R. Cook and S. L. Cohoon, Sacramento, Cal.; one-third assigned to Thomas Scott, same place. No. 626,487. Dated June 6, 1899. The object of this invention is to provide an automatically self-cleaning filter, and means by which it is thus cleaned whenever water is drawn through the apparatus. It comprises an inner hollow filtering cylinder with a discharge opening, an outer casing with supply passages to admit the water to be filtered between itself and the filter, brushes adapted to contact with the surface of the filter having swiveled arms by which they adjust themselves as they move about it, and a driving mechanism actuated whenever the faucet is opened to cause these brushes to rotate and thus brush off the outer face of the filter to prevent any gathering of sediment or deposit thereon. The mechanism for driving the brushes may be a bucketed wheel loosely turnable and so connected as to carry the brushes with it. Jet tubes discharge water into the buckets of the wheel whenever the faucet is opened and thus cause it to operate.

ICE CREAM MOLD AND MEASURE.—F. E. Schmits, Oakland, Cal. No. 626,468. Dated June 6, 1899. This invention relates to a device for measuring and molding ice cream, water ice and similar condiments, and a means by which the material thus molded is afterwards loosened and discharged from the mold. The mold and measure may be of any suitable or desired shape, and preferably as scrapers pivoted and turnable within it. A polygonal stem to which the scrapers are fixed extends axially outward through the end of the mold, a pinion journaled in line therewith has a socket with which the steam engages and other pinions engaging it are actuated by a movable handle so that when turned the scrapers move around the inside of the mold and attach the contents which can thus be discharged. One of the handles for holding the device is stationary, while the other which is fixed so as to turn the train of gearing, is movable and may be operated by one hand. A suitable clutch mechanism causes it to engage and rotate the scraper arms when the handles are pressed together, and they are allowed to remain stationary when the handles are separated by a spring which acts for that purpose. The device can thus be operated with one hand, leaving the other free for other purposes.

HEATING FURNACES.—A. Johnson, San Francisco, Cal.; assignor to the Oil Fuel Saving Co. of same place. No. 626,465. Dated June 6, 1899. This invention is especially designed to be used in conjunction with furnaces where heat is required, either for making steam, or for roasting or smelting ores, or any other uses where heat and perfect combustion are required. it consists of a main combustion chamber, a communicating primary combustion chamber below the front portion thereof, a discharge pipe, oil and air supply pipes, connections between these and a transverse pipe so that the air admitted through the air pipes will be delivered into the discharge pipe, mixing and delivering with the oil which is delivered therefrom.

CONCENTRATOR BELT.—George Gates, Jackson, Cal. No. 626,461. Dated June 6, 1899. The object of this invention is to provide an endless traveling belt with a surface upon which a separation and concentration of heavy, valuable substances can be accomplished and such separation made more closely than with the concentrators now in use. It consists of an endless, longitudinally inclined belt having a series of wide, longitudinally inclined surfaces with shallow, vertically connecting offsets; drums upon which the belt is movable, these drums being so disposed that the belt surfaces have a slight backward inclination toward the foot of the preceding offset or step so that extended surfaces are formed for the settling of the sulphurets upon the tables while the lighter pulp will flow over the surface of the sulphurets and discharge onto the next table, each table thus retaining a bed of sulphurets which are eventually carried up by the travel of the belt and delivered in the usual way over the upper end.

Another Kind of a Sinker.



The Hooker Double Acting Pump.

Well built, simple, durable, efficient.

All working parts easy of access.

Duplicate parts in stock.

We furnish these pumps with suction pipes, hose and strainers complete. Estimates on application.

Can furnish up to number three with double brake for hand power.

Just the pump for a small mine. Larger sizes, larger capacities.

Our 1899 catalogue tells about over fifty different kinds of pumps. Sent on application.

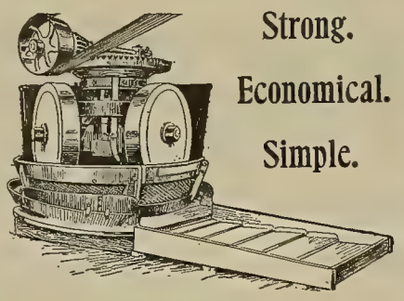
THE BRYAN ROLLER QUARTZ MILL.

We are the sole manufacturers of this Mill. A test made by the Bullion-Beck Co. of Eureka, Utah, with this and the Huntington Mill proved conclusively every claim we made for the Bryan Mill, viz: that the Bryan would crush more ore with less repairs, less power and less slimes than any Mill made. Result — they are now operating three of the five-foot Bryan Mills and find them superior and more satisfactory than any Mill they ever used. L. C. Trent & Co., who had formerly sold the Huntington Mill, immediately manufactured a Mill infringing our patent. Suit brought in the U. S. Court resulted in a verdict in our favor, and we shall prosecute to the full extent of the law any infringement of any character whatsoever in the MAKING, USING or SELLING of the same. : : : : : : : : : : : :



Strong.
Economical.
Simple.

MANUFACTURED BY

The BRYAN MILL is constructed on the principle of the Chili Mill, except it has three rollers arranged to run in a continuous discharging pan. It crushes either gold or silver ores. It consists of an annular cast-iron mortar with fixed steel dies arranged in the path of its three crushing rollers. Power is applied direct from a pulley through a bevel gear and pinion secured to stationary center post. We present a few of many advantages it possesses over any other Mill: Larger screen capacity and free discharge. Amalgamates a larger percentage of gold. Quickly and cheaply erected; with regular feed and proper flow of water requires little attention. Crushes hard or soft ore with smaller amount of power per ton and less wear and tear of machinery. : : : :

205-211 Third Ave., NEW YORK.

The State Ore Sampling Co.

DENVER, COLO.

We buy Gold, Silver, Lead, Copper, Bismuth, Uranium, Wolfram, Cobalt and Antimony Ores. We have modern sampling mills, also test ore for the new processes of ore reduction.

Our long experience in the market enables us to obtain the highest prices for all marketable ores. Write for our "Reference Book." Send analysis of your ore for prices and information.

BAILY & MONNIG, Managers.

Mining and Metallurgy.

The latest and best books can be had from the Book Department of the MINING AND SCIENTIFIC PRESS at best prices. ALL BOOKS SENT POST-PAID. Following is a partial list:

ASSAYING:—PART I—GOLD AND SILVER ORES.
Third edition; Rewritten and Improved by the Author, C. H. Aaron; 130 pages, illustrated....$1

MODERN COPPER SMELTING:
E. Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated.....$5

STAMP MILLING OF GOLD ORES:
By T. A. Rickard, M. E. Well illustrated. Cloth $2 50

MANUAL OF MINING:
For the use of Mining Engineers and Technical Schools. M. C. Ihlseng. Third, revised and enlarged, edition. 548 pages, 8vo., cloth.....$4

MINERS' POCKETBOOK:
A reference book for miners, mine surveyors, geologists, mineralogists, millmen. assayers and metallurgists. By C. G W. Lock. 472 pages, illustrated, flexible leather.....$5

THE METALLURGY OF GOLD:
By M. Eissler. Profusely illustrated..... ...$5

QUARTZ OPERATOR'S HANDBOOK:
By P. M. Randall..... .....$2

CYANIDE PROCESSES FOR GOLD AND SILVER ORES:
By E. B. Wilson E. M.....$1 50

PRACTICAL TREATISE ON HYDRAULIC MINING:
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, etc.....$5

PRACTICAL HYDRAULICS:
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall.....$2

SKELETON MINING REPORT:
Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid..... ..50c

ROASTING OF GOLD AND SILVER ORES AND THE EXTRACTION OF THEIR RESPECTIVE METALS WITHOUT QUICKSILVER:
Second edition; Guido Kustel, M. E.; 156 pages, with illustrations of furnaces, supplements and working apparatus..... .....$3

PROSPECTOR'S FIELD BOOK AND GUIDE:
4th edition, just out. By H. S. Osborn.....$1 50

GEOLOGY:
Emmons, $1 50; Le Conte, revised edition, $4; Dana, 4th edition.....$5

IRON AND STEEL:
Thurston, 6th edition.... .....$3 50

LITHOLOGY:
Williams, 2nd edition.. ....$3

HYDRAULIC GOLD MINING:
Kirkpatric..... .....$1

LIEBER'S CODE:
Bound in leather.....$3

MINERALS:
"How to Study Them," Dana, 2nd edition, $1 50; Dana, American locality of mineral, 6th edition..... .....$1

ASSAYING:
Furman, 4th edition... ....$3

HIGH EXPLOSIVES:
Eissler..... .....$4

GOLD ORES:
Treatment of; O'Driscoll.....$2

MINERALOGY:
Brush & Penfield, revised edition, $4; Dana, 6th edition, $12 50; Dana, for beginners, $1 50; Dana, Mineralogy and Petrography, 12th edition.....$2

METALLURGY:
Eggleston, Silver, Gold and Mercury, 2 vols.$15

TUNNELING:
Blasting, Timbering, Air Drilling, etc.; 1000 illustrations; Drinker, 3rd edition.....$25

CHLORINATION PROCESS:
E. B. Wilson.....$1 50

HYDRAULIC AND PLACER MINING:
E. B. Wilson $2

ALLOYS:
Thurston, 2nd edition..... ....$2 50

Mines and Machinery for Sale at Public Auction.

The Harqua Hala (Arizona) Gold Mining Company will on Monday, August 14th, 1899, at 12 o'clock noon of that day, at the Court House door at Yuma, Arizona, offer for sale to the highest bidder all its mines, mill site, pumping plant, 40-stamp mill, cyanide plant, engines, boilers, machinery (fixed and movable), and stock of merchandise situated at Harqua Hala, Yuma Co., Arizona. Inventories and information may be obtained from C. Dallman, agent at Harqua Hala, or Lindley & Eickhoff, attorneys, 530 California St., San Francisco. Terms of sale: Cash, U. S. gold coin, payable twenty per cent on acceptance of bids, balance on delivery of possession. Title to mines U. S. patents. By order of the Board of Directors.

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'S Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

DEWEY, STRONG & CO.,
PATENT AGENTS,

And in accordance with law, and an order from the Board of Directors, made on the 13th day of May, 1899, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 217 Sacramento street, San Francisco, California, on MONDAY, the 3rd day of July, 1899, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

CHARLES BOVONE, Secretary

Office—217 Sacramento street, San Francisco, California.

RUPTURE AND PILES.

For May and June, 1899, only, **Drs. Mansfield & Porterfield, at 838 Market St., San Francisco,** are issuing certificates entitling the holder to free examination for **Rupture** or **Piles**, with treatment till cured, for $30. Send for one.

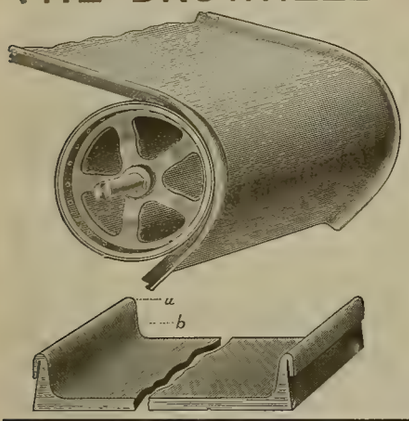
THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.



It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

SUPT. OFFICE WILDMAN GOLD MINING COMPANY,
SUTTER CREEK, AMADOR CO., CAL., Feb 22, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: Replying to your favor of the 18th inst., will say that in the two mills operated by this company we have nineteen of your Patent Lip flange concentrator belts in use; some of them have been in constant use for the past two years and have given entire satisfaction. I know of no better flange for a side shake machine.

Yours truly, JOHN ROSS JR., Superintdenent.

MEXICAN MILL. EMPIRE, NEV., March 28, 1897.

MR. J. S. BROWNELL, San Francisco, Cal.—DEAR SIR: For some years we have used three different styles of belts on our Frue vanner at the Mexican mill, and for smooth working and endurance the Brownell Patent Lip flange belt has proved its superiority over all others, and I unhesitatingly recommend it to all who are using Frue machines.

Yours truly, EUGENE MAY, Foreman.

—MANUFACTURERS OF—

Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines
OUR SPECIALTY.

We build **GOLD DREDGES COMPLETE IN RUNNING ORDER** to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard. We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.

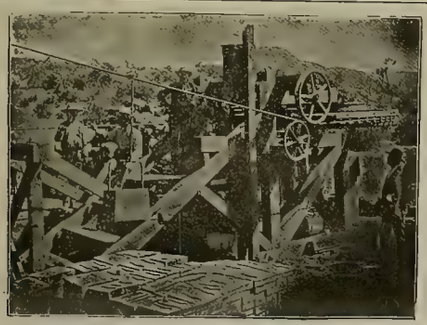
Send for Dredging Catalogues Nos. 15 and 16.

WE ALSO BUILD

All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

We publish sixteen catalogues. Write for one in the line you are interested in.



THE HALLIDIE ROPEWAY

For transporting Ore, Fuel, Merchandise, etc., in bulk or in packages. SIMPLE, ECONOMICAL, INEXPENSIVE, PRACTICAL.

AND PACIFIC ELECTRICAL REVIEW.

No. 2032.—VOLUME LXXVIII. Number 24. SAN FRANCISCO, SATURDAY, JUNE 17, 1899. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Value of Comparisons.

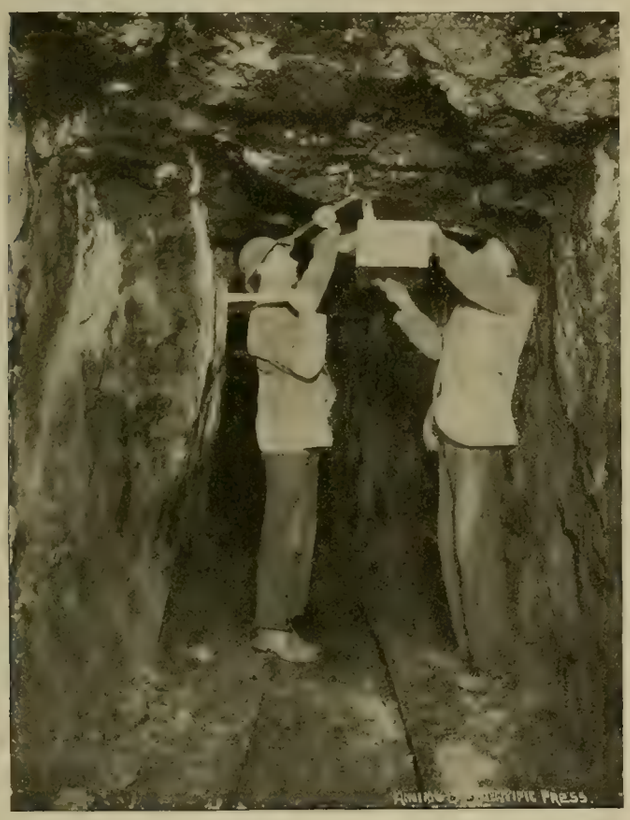
Considering the importance of the mining industry to California, too little attention is given to securing accurate information relative to the cost of operating mines under varying conditions. The simple statement that this or that mine is operating at a cost of $1 or less per ton has no particular significance unless the statement be accompanied by a description of the mine—its geology, character of rocks and of the ore, quantity of water handled, etc. It is only by comparison that these statements are made valuable. If a mine of a distinct type, isolated from all others, and unlike all others, can be operated at a cost so low as to attract attention from mining men everywhere, it has no particular value further than it concerns that mine; but if a mine is only one of a number similar in character and similarly situated, any radical difference in cost of operation would attract equal attention and a remedy would doubtless be sought, for what can be accomplished at one place under certain circumstances should be accomlished at another place where the conditions are the same. A mine may be more cheaply operated with steam, where fuel is very cheap, than one with water power, where the cost of water is very high. The question of wages is also an important one. With a plant of given capacity and a mine of equal size and character, it would cost more to operate a mine in Butte City, Montana, where wages are $3.50 per day than in Tennessee, where wages are about $1.25. It may be that there is greater efficiency in the higher priced labor, but it is not likely that the difference is in the ratio of the respective wages. The same difference exists in the treatment of ores. No comparisons of value can be made when all the conditions having a bearing on the matter are not known. It is to enable mining men to make valuable deductions by comparison that such detailed and accurate information should be sought and made public.

New Old Mines.

Among the most prominent and the best paying mines in California are several which, after the abandonment of years, have been reopened and are now operated successfully. Among these are the Kennedy mine at Jackson, Amador county, and the Gwin and the Utica mines in Calaveras county, also the Rawhide and App mines in Tuolumne county. Besides these, there are a number of others which will probably soon be added to the paying list, including the Central Eureka and Oneida in Amador county, the Melones Con., Sheep Ranch and Angels mines, in Calaveras county, and several smaller mines in Tuolumne and Mariposa counties. Among the most important factors in the development and success of these new old mines are improved methods, superior management, better machinery, lower wages, cheaper supplies and mill processes which save a higher percentage of values at less expense than in former years. The possibilities of these old mines which were once operated with profit and then closed down is fully demonstrated in these recently opened mines, and there are numerous similar opportunities awaiting the investment of capital.

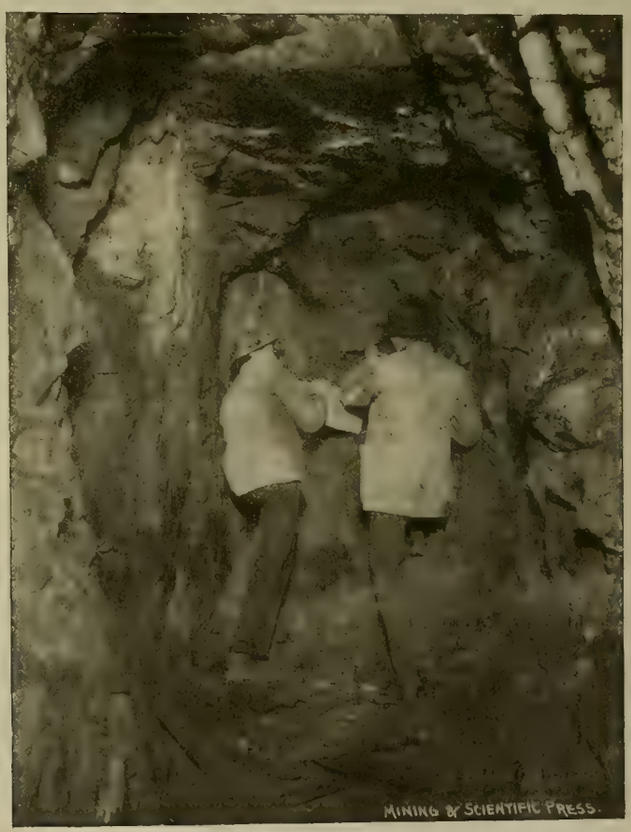
Mine Sampling.

No duty which falls to the lot of the mining engineer calls for an exercise of greater caution than the sampling of a mine. It is a well-known principle that a sample which is not a sample is worthless for either owner or prospective buyer. Often the obtaining of samples is accomplished under great difficulties. The illustrations appearing on this page are those of men in the act of sampling the Independence mine at Cripple Creek, Colo. Under some circumstances the use of the moil is undoubtedly the best for taking samples, as the rock detached by this means can usually be secured in the desired amount, and can be prevented from flying off under the force of the blow, as is often the case in the use of a pick or hammer. The value of the services of a man who can correctly sample a mine cannot very well be estimated on a basis of time.



TAKING SAMPLE IN BACK OF DRIFT, INDEPENDENCE MINE, CRIPPLE CREEK, COLO.

(See page 636.)



TAKING SAMPLE IN FACE OF DRIFT, INDEPENDENCE MINE, CRIPPLE CREEK, COLO.

THE Sauerwald Development & Promotion Syndicate, Ltd., is the title of a new English concern which has gone into the business of gold winning—from sea water. No one will deny that the business is legitimate if they can make a success of it. Metallurgy has made great strides lately, but it has not yet reached a point where the water from the ocean can be made to yield up its gold in profitable quantity. These enterprising promoters doubtless claim to have a sure thing, as did certain New England people not long since. The credulity of some people surpasses belief, for people are said to be actually subscribing for the stock of this salt sea bubble.

STEEL and iron are still rising in price. The unusually large demand for steel and iron and the lateness of the arrival of vessels from the Lake Superior regions at the Lake Erie ports with iron ore combine to keep up the price.

THE new Washington State mining law requires a 10-foot shaft on all quartz mining claims before the act of location is completed. An equivalent amount of work is required on placer locations. The law went into effect on the 7th inst.

PROSPECTORS continue to leave for the new gold fields in Lower California. Some of the most recent reports tend to the belief that gold cannot be obtained more readily there than elsewhere without a proportionate amount of labor.

ON June 1st, when the eight-hour law went into force in British Columbia, 400 men in the Slocan district quit work, for the reason that the mine managers would only pay for eight hours work at the same rate per hour as had been paid for ten hours.

COMMISSIONER OF PATENTS DUELL reports the receipts of the Patent Office for last month to be $116,386.87. For the corresponding month last year the receipts were $88,558.41. The number of applications for patents, including designs, for May, 1899, was 3856, as against 2870 for May, 1898.

A NEW MINING COMPANY has recently been incorporated in Arizona which claims to have 8,000,000 tons of copper, gold and silver ores in sight, in Pima county. This may be considered a very fair start for a new enterprise. No statement as to the value of this ore and cost of mining and treatment is at hand.

THE average cost of the production of gold is lower at the present time than at any time in history, and, as a result, a decided impetus is given the gold mining industry. Attempts to work low-grade ores, where failure resulted a few years ago, are now meeting with success as a result of the changed conditions.

NO CLASS of men in new mining regions do more to retard the development of mines than those who stake all the ground they can possibly cover regardless of the law or the rights of others. Those who would locate and work on claims if they could have the opportunity are unable to buy out these wholesale locators and do not wish to take issue with them at law for obvious reasons, though their case would in most instances be won in the courts. Local rules should limit the number of claims which one person could locate.

Effect of the Eight-Hour Law.

The result of legislative interference, in the passage of the eight-hour law, with a condition of affairs which, if not wholly satisfactory, was at least peaceful, and under which the mining industry and all concerned in it were prospering, is in evidence in Colorado and British Columbia.

Ever since the passage of the eight-hour law by the Colorado Legislature trouble has been anticipated when the time arrived for the law to go into effect, June 15. It is learned that 3000 men employed in various smelting concerns at Denver, Pueblo and Leadville have quit work owing to the differences arising between the workmen and smelter managers as to hours of labor and wages. Several days since notices were posted in and about the smelters stating that thereafter men would be employed by the hour, no man being required to work longer than eight hours during twenty-four, but giving the privilege of working extra time, this being wholly optional. Later a raise of about 10% in wages was announced. That these arrangements did not meet the approval of the workmen is evident. It is asserted that unless the matter is speedily adjusted upward of 40,000 men will be thrown out of employment, as the mines, unable to find a market for their ores, must also close down. The railroads running into the mining districts would also be heavy losers.

In the Slocan region of British Columbia the miners have quit work, refusing to work eight hours for less than the pay formerly received for ten hours' work. That eight hours work is enough in twenty-four in many mines where there are floods of water and poor ventilation, there can be no doubt; but this condition does not obtain in all mines, and the claim that the miners will accomplish as much or more work in eight hours as in ten will scarcely be credited, even if it were so.

In some instances mining companies have also offered to pay by the hour with the overtime privilege, which would be satisfactory, perhaps, in many cases, but would be a violation of the law which makes it unlawful to employ men in a mine longer than eight hours in any twenty-four.

These affairs have reached an unfortunate stage, but it is to be hoped that a just regard for the right on both sides of this question may ultimately prevail. Such things necessarily adjust themselves, as they always have.

"DEEP-LEVEL mining in the Transvaal, as far as the first row of deep mines is concerned," says the *South African Mining Journal*, "has thus far, under careful, experienced management, proved an unqualified success, and the time is not far distant when the second line of deep shafts will enter the ranks of producers." The difference between very deep mining and that which is moderately deep is in some cases so radically different that success may not attend the efforts of those who do not fully grasp the situation in its broadest sense and who are able to meet the changed conditions with the necessary financial outlay. Deep mining—that is, mining deeper than 3000 feet—involves, usually, very heavy surface plants, the lifting of larger quantities of water to greater heights, and, possibly, increased temperature; but, from a mechanical standpoint, it may be said that mining will be carried on to a depth as great as it is possible to sink shafts and hoist heavy loads with a single cable. When a cable is very long—3000 feet or more—the "springing" of the rope is the cause of some difficulty, but the inconvenience caused by this is usually overcome by the use of chairs at the stations. To how deep a point mining can be carried on successfully is not known, but it is believed to a much greater depth than the deepest mines of the present day—about 5000 feet. Economic conditions usually determine the depth to which a mine is worked; but, if the value of ore deposits warrant it, it is safe to say the depth to which mines will be worked will be very materially increased.

WHAT is alleged to be a "petrified man" is being lugged about the rural and mining districts of California by men who claim to have discovered the "man" in Death Valley while prospecting. When last heard from they were headed for Oregon. This sort of "fake" has been worked on the people so often and so frequently exposed, it is amusing to see that the old trick still works, and people actually pay to see such a creation. On second thought, perhaps people who are so easily taken in might spend their money more foolishly. Such a thing as a petrified human body does not exist, and never has. Bones sometimes become petrified, but the fleshy tissues are not subject to replacement in the same manner that bones, wood and some other organic substances are, for the simple reason that the tissues are destroyed by decomposition before the atomic replacement of inorganic for organic matter can be accomplished.

THERE is usually a vast difference in current reports from a mine that is being boomed by every conceivable device for what can be made in a stock operation and one which is worked for what there is actually in it. A great deal of free advertising has recently been given a noted mine location in the Northwest. Statements of fabulous values are commonly made, in connection with enormous breadth of ore bodies. The papers are full of it. During the last four months a large force of men has been reported engaged in development work and have succeeded in sinking a small shaft 60 feet in soft rock. In comparison with this is a gold mine in the Southwest which for months past has shipped several hundred thousand dollars monthly and yet its name in print is a rarity. These two make a decided contrast.

SOME of the United States Consular reports, particularly those which deal with mining and the mineral resources of foreign countries, are of unusual interest. Consul Fowler, writing from Chefoo, China, Feb. 16th, '99, says that, at his request, E. D. Sims of Tai-au-fu has sent an interesting report on the coal and other mines of that department. In his report Mr. Sims writes: "I send you a very good specimen of galena, very rich in sulphide of lead, and I am told it would make very good German silver." The correspondent also writes of a "vein of pure silver assaying from $600 to $1000 per ton." It is unfortunate that consular reports, which should consist of reliable information from the most responsible source, contain such foolish statements as the above.

AT the mines of the Mountain Copper Co., near Keswick, Shasta Co., Cal., 450 miners have quit work owing to a refusal of the management to meet a demand for an increase of 40 cents per day for all classes of labor. Various complaints are made by the men. They assert that the mine is worked in a reckless manner; that the ore is stoped from large masses without sufficient precaution being taken in the way of supporting the ground, to insure the safety of the men, and that, as a result, the ground is settling. This condition of affairs, if it exists, is in itself sufficient cause for refusal to work. It is also claimed that the accommodations are insufficient and squalid and that the food provided by the company is of inferior quality.

A FEW WEEKS AGO every one interested in affairs commercial and political in the Transvaal looked forward to the meeting of President Kruger and the British Commissioner, Sir Alfred Milner, with much hope for an improvement in existing conditions. These gentlemen met, but contrary to the hope entertained by many, failed to arrive at a satisfactory solution of the problems presented. It now looks as though the difficulties are multiplying instead of otherwise. The Uitlanders demand equal political rights with the Boers, and also numerous "reforms" in matters relating to mines. Thus far the Boers have declined to meet these demands.

A FURTHER ADVANCE in the price of silver is predicted by some who are looked upon as authority. The reasons given for this happy anticipation is largely increased use in the arts and manufactures due to low prices of silver, and the greatly extended use of the metal as a circulating medium in Oriental countries now about being opened up, particularly in China.

THE latest in the world of practical science is the effort of Prof. Dewar of London to cast steel in a vacuum, by which means it is thought gas bubbles and blow holes, so detrimental to steel, will be avoided.

Concentrates.

A LEAD and zinc mine is being opened at Bristol, New Hampshire.

LOCATION certificates when placed on record do not require stamps.

A PLACER LOCATION may be made in contiguous tracts of ten acres each.

COPPER and silver ores occur in quartz porphyry in the Lava Beds district of San Bernardino county, Cal.

THE Ontario vein at Park City, Utah, is a vein in quartzite, from which $13,559,500 have been paid in dividends.

IN drifts the bottoms of which are soft and wet, sills should be placed to afford firm support to the posts of the drift sets.

LAND in California more valuable for limestone or marble than for agricultural purposes may be located under the mining laws.

LANDS lying between high and low tides belong to the State, and placer claims located thereon cannot be sold by the United States.

THE slow backward movement of abrupt rock faces due to weathering has been called the recession of cliffs, a very appropriate name.

THE slates of the Mariposa beds of the California gold belt are proven to be of Cretaceous by the appearance of casts of the fossil aucella.

SEDIMENTARY STRATA to a depth of 11,000 feet have been removed by erosion in some portions of the Grand Canyon region in southern Utah.

MICA of merchantable character is found in several localities near Custer City in South Dakota. The mineral occurs in coarse granitic veins.

A SURVEY of a mining claim made before the date of recording the location of the claim cannot be regarded as the official survey contemplated by law.

IT is not necessary that the "discovery shaft" should contain mineral or ore. If mineral in place is found on any portion of the claim, it is all that the law requires.

MINERS can survey their own claims with considerable accuracy by using a common open-sight compass provided with sights and by taking care in making measurements.

WHEN estimating the $500 worth of work necessary to secure patent, any work done by former owners who had abandoned their claim cannot be considered as part of the expenditure.

WHEN making application for a patent to placer ground care should be taken to determine the exact classification of the land, and the clearest evidence possible should be presented.

QUICKSILVER is obtained on the Pacific coast from four minerals—cinnabar, metacinnabarite, native quicksilver and tiemannite (mercuric selenide). This latter occurs in Piute county, Utah.

THE development of a mine is exploration. The stoping and working of a mine after it is developed is exploitation. A good maxim in mining is keep exploration well in advance of exploitation.

A NORMAL FAULT is one in which the hanging wall has sunk relatively to the foot wall, and a reverse or thrust fault is one in which the hanging wall side has moved upward relatively to the foot wall.

A MINING CLAIM is not subject to relocation by other parties until an abandonment by the original locators is established. Non-compliance with the laws, federal and local, constitutes an abandonment.

IT has been asserted that all pyrite contains gold in some amount, but careful tests have been made by some of the most expert chemists of the United States Geological Survey and pyrite frequently found which showed no trace of gold.

IN the early stage of development of a quartz mine it is often impossible to tell whether or not the ground is more valuable for mineral or agricultural purposes. A vein small and low-grade upon the surface may develop into a very valuable mine in depth. Several such instances are of record in California.

THE zone of oxidation in the copper mines of Butte, Montana, ends very abruptly, usually, the oxides and carbonates giving place within a few inches to ores of the normal sulphide type. In the Homestake mines of South Dakota, sulphide ores are found on every level below the 100, but oxidized ore is found as low as the 400 level.

AN anticlinal fold is one in which the strata dip in both directions from the crest of a fold. A synclinal fold is one in which the strata dip toward each other from opposite directions. A quaquaversal fold is one in which the strata dip away in all directions from the crest of an uplift. A monoclinal fold is one dipping in one direction only.

A SIMPLE fissure vein is one having well defined walls, a nearly straight or slightly curving strike and dip. Pieces of the country rock are often included, as though they had fallen into an open crevice. Such a vein as this not infrequently has a banded structure. This is the type of vein frequently figured in textbooks but not often seen in nature.

WHEN using hanging bolts in shafts, use only large sized iron washers. There is no economy in small washers. A 4 or 5-inch washer is far better than one 2½ inches in diameter, for should any downward pressure exert itself the small washers will sink into the plates and there is sure to be a subsidence in the shaft sets. Large washers will obviate this to a great extent.

CHLORIDE OF SILVER is soluble in a solution of hyposulphite of soda, from which the silver may be precipitated in the form of black sulphide of silver by the introduction of sodium or calcium sulphide. These reactions are the basis for the lixiviation process of working silver ores. When ores are not naturally in the state of chloride, they are chloridized in a furnace and the roasted ore leached.

OVER 5,000,000,000 gallons of petroleum are now produced annually in the world. Of this amount 2,500,000,000 are produced in the United States, 2,250,000,000 in Russia, and the remainder is distributed among a dozen countries, Austria 87,000,000, Sumatra 72,000,000, Java 30,000,000, Canada 29,000,000, Roumania 24,000,000, India 15,000,000, Japan 8,000,000, Germany 7,000,000, Peru 3,000,000, and Italy about 1,000,000 gallons.

IN the Manzanita mine on Sulphur creek, in Colusa county, Cal., cinnabar occurs associated with gold. With these minerals are pyrite, and marcasite, chalcopyrite, stibnite, calcite and quartz. The gold is often visible in groups of feathery crystals sometimes in contact with cinnabar and sometimes deposited on the calcite, which is usually more abundant in the ore than quartz. A large amount of native sulphur occurs in the mine.

THE spectroscope is employed to determine the elements in any body when heated to an incandescent state. Distant stars—not planets, but burning suns like that of the solar system, show the lines in the spectrum characteristic of many elements familiar to chemistry. The moon's rays produce none of these characteristic lines on the spectrum, hence it is impossible to say what elements exist in the moon, but the elements of some fixed stars are, according to the spectroscope, singularly like the earth.

EARTHQUAKES are supposed to be due to the readjustment of the earth's surface or crust enveloping the heated interior, which is believed to be slowly cooling. The unequal contraction due to this causes the seismic disturbances. A period of repeated earthquakes is often, if not always, followed by a more or less violent eruption of some volcano. Whether there is a direct connection between the earthquakes and the volcanic outburst, or whether it is only a coincidence, can only be surmised.

WHERE shafts are sunk through ground which is not solid enough to afford good support to the timbers by wedging, reachers should be put in every 30 to 50 feet. These are let into the walls, the ends resting on hitches cut deep enough to hold, and the timber firmly wedged. The plates of the shafts rest on these reachers at intervals and they support the weight of the several sets above as far as the next reacher, or at least such weight as there may be. This keeps the shaft sets firmly in place, and there is little danger of collapse.

THE swelling of rock in mines is due to various causes, among them being a molecular enlargement of the constituents of the rock mass upon being exposed to the atmosphere. In some cases very soft rock is forced into the workings by pressure from the surrounding rocks. The pressure exerted by swelling ground is almost irresistible, and cannot be held by timbers without relieving the ground. It is cheaper in the end to sink the shaft of a mine in the hard rock of the foot or hanging wall rather than in the soft crevice of a vein, the walls of which are swelling ground.

WHEN shafts are sunk in rocks firm enough to stand without timbering the shaft may be divided into two or more compartments by means of heavy timbers placed vertically above each other at stated distances, these timbers reaching from wall to wall of the shaft. To these may be secured the guides in vertical or steeply inclined shafts. In some inclined shafts even these dividing timbers are dispensed with, only plates being put in on the footwall side to carry the runway for skips or buckets, ladders, etc., and only such dividers as are necessary to support air, steam and water pipes.

NOT infrequently one reads of and hears of dykes of quartzite. Quartzite is a metamorphic sand rock formed by an infiltration of some cementing material, such as iron, carbonate of lime, or silica, usually the latter, and in many if not all cases where silica is the cementing material, a secondary enlargement of the individual grains of sand making up the rock mass has occurred, each grain taking on a normal crystalline form. The envelopes of silica which surround the grains coming in contact with each other fill all the interstitial spaces and form a firm, solid rock, so it will be seen that quartzite is in no sense a dyke rock. These beds of quartzite are sometimes also called reefs, which is a more appropriate term.

ON what grade must a flume be built for it to discharge a given quantity of water in a given time? Divide the number of cubic feet of discharge wanted by the area of the section of the flume in square feet. This will give the necessary velocity. Multiply this result by itself and multiply the product by the wet perimeter, in feet, of the flume and multiply the product by decimal .0001114. Divide the product by the area of the section of the flume, expressed in square feet. Call this A. Multiply the velocity in feet per second by the wet perimeter, in feet, and multiply the product by decimal .00002426. Divide the product by the area of the section of the flume, in square feet. Call this B. Add A and B. The result will be the grade expressed in decimals of a foot.

A VERY small amount of iron has been manufactured on the Pacific coast, at Clipper Gap, Placer county. In 1891 furnaces were erected at Roseville near the mouth of San Diego bay for the manufacture of iron direct from ore by the Eames process, but further than the construction of furnaces of the reverberatory type the proposition did not go. By this process the ore was to have been ground to pulp, mixed with retarded coke (coke which has been dipped in clay water and dried) and spread on the hearth of the furnace. Petroleum under blast was to to have been utilized for fuel. The process seemed reasonable, and was in actual use in Pennsylvania, where it is known as the Carbon Iron Company's process, where natural gas was the fuel used, about 30,000 cubic feet of gas being consumed in making a ton of iron.

THE determination of rocks is made in two ways—by chemical analysis and by means of the examination of thin slices of the rock under a microscope. The latter method possesses many advantages, as it shows not only each mineral composing the rock mass, but it also shows the structure and the relations which the rock constituents bear to each other. Internal strains and movements of the grains or crystals composing the rock can be detected as well as alterations from one mineral to another, as the alteration of augite to green hornblende (uralite) and the further alteration of the uralite to chlorite and alteration of the latter to epidote. Each of these minerals may sometimes be observed in a single rock section grouped about a central crystal of augite, showing clearly the transition of one mineral to another, giving information which would be wholly lost by chemical analysis. The use of the polarization microscope, more than anything else, has thrown light upon the alteration of massive eruptive rocks to schistose and slaty condition.

IT is generally conceded by the highest authority that the existence of open spaces are necessary for the formation of ore deposits of any kind. These open spaces may be extremely minute, interstitial openings in fractured, crushed rock mass, or they may be of considerable size in a coarse breccia. The ore may have been deposited in these open spaces between the pieces of the fractured rock mass or in the small cavities between the grains of porous rock, as sandstone. Some ore deposits undoubtedly have been formed by replacement—that is, as the mineral-bearing solutions passed through the rock, atoms of the rock mass were dissolved and carried away in solution, being replaced by atoms of the sulphide minerals now constituting the ore deposit. Bodies of lead, iron and zinc sulphides in limestone are typical of this method of formation, while deposits in sandstone are well illustrated in many California quicksilver mines. There is nothing to support the belief that the spaces now occupied by large ore deposits were at one time open caverns.

CONCERNING the location and recording of mining claims, the United States law says: "The miners of each district may make regulations not in conflict with the laws of the United States, or with the laws of the State or Territory in which the district is situated, governing the location, manner of recording, amount of work necessary to hold possession of a mining claim, subject to the following requirements: The location must be distinctly marked on the ground, so that its boundaries can be readily traced. All records of mining claims hereafter made (May 10, '72) shall contain the name or names of the locators, the date of location, and such a description of the claim or claims located by reference to some natural object or permanent monument as will identify the claim, etc." It will be noticed by the foregoing that miners may organize districts and may also determine the manner of recording. This, without doubt, contemplates the election of a local district recorder, and any record of location properly made with him in accordance with the United States statutes would be perfectly legal. The language of the Civil Code of California, Section 1159—"notice of location may be made with the county recorder," etc., does not make it compulsory. A safe plan would be to record a location with both the district recorder and the county recorder. The county records are usually kept in a safe place where they are not likely to be destroyed by fire or otherwise, while in many cases those of the district are exposed to danger of destruction. If a mining claim is worth anything it is worth recording in such a manner as to insure the validity of title.

WHERE a tunnel is located, under the tunnel right law, for the purpose of the development of a vein or lode, or for the discovery of veins, the owners of such tunnel shall have the right of possession of all veins or lodes within 3000 feet from the mouth of said tunnel on the line thereof, not previously known to exist, discovered in such tunnel, to the same extent as though discovered on the surface; and locations on the line of such tunnel of veins or lodes, not appearing on the surface, made by other parties after the commencement of such tunnel, and while the same is being prosecuted with reasonable diligence, shall be invalid. But failure to prosecute the work on the tunnel for six months shall be considered as an abandonment of the right to all undiscovered veins on the line of such tunnel. A vein discovered in such tunnel not previously located on the surface may be located by the owner of the tunnel, who may take 1500 feet along the line of the discovered vein. When such discovery is made a location notice should be posted on the surface, giving notice of such appropriation and marking it by posts or monuments. This notice should be recorded. The discoverer should raise from his tunnel or sink a shaft and determine the apex of the vein on the surface, and the surface ground included in the location, as in a location made on a surface discovery. This is in accordance with the views of the land commissioner, but the Supreme Court of Colorado held that a notice posted at the mouth of the tunnel, stating at what distance from the mouth of the tunnel the vein was discovered and the number feet on each side of the center of the tunnel claimed, was sufficient.

SHAFT TIMBERS may be cheaply and quickly framed by use of templates, which make all framing uniform. Of the several systems or methods of framing shaft timbers at the corners, the overlap joint is simple and easily made. This method is employed in vertical shafts only and is framed by cutting out one-half the thickness each of the wall plate and end plate to a width equaling the width of the timber. The upper half of the wall plate is cut out and the lower half of the end plate is removed. The wall plates are first placed in position as nearly as may be, being swung on hanging bolts. When both timbers are on the bolts, a gauge is slipped in at each end, by means of which the timbers are adjusted at the proper distance from each other, when they may be secured in that position by tacking a piece of lagging on top of the plates near each end. The end plates are then dropped in and the set wedged to place, which is determined by a plumb line in each corner, suspended from sets above which are known to be in line. The lines should take in not less than three sets in height. If four lines are not used, the sets are likely to be wedged out of line. Lining up sets is a particular job requiring care, patience and good judgment. It pays to do shaft work well, and good enough is only good enough when it can be no better. A slight departure from the true line is scarcely noticeable at first; but, as set after set is put in place with equal carelessness, it soon develops a shaft which is not a credit to anyone. In inclined shafts a dovetailed notch is cut near each end of the wall plates and a corresponding tenon cut on the end plate. The timbers are placed in the same manner as explained above. Timbers framed in this way may also be used in vertical shafts. This latter method requires less timber. Where absolute rigidity is required in shaft sets, it is good practice to put posts at each corner, and in large shafts also at the center, or opposite the dividers. When the shaft is being lagged have the post of the same size as the plates, or, at least, one dimension of the same size. If 10x12-inch plates are used, they should be put in with the 12-inch face upward. The posts should be 8 or 10 by 12, the outside faces being placed flush with the outside of the plates. This will make the posts line up with the lagging, and no lagging need be put behind the posts. The amount of timber required is less, and the saving in time in putting in is an item of even greater importance.

Cyaniding Slimy Ores and Tailings.

Written for the MINING AND SCIENTIC PRESS by MATT. W. ALDERSON.

Part III.—Decantation.

When agitation has ceased, the vat is allowed to stand and the charge settles. By glass tubes, ½-inch in diameter and from 2 to 5 feet in length, the depth of the clear fluid can be easily ascertained. In one or two hours, when material is not very slimy, decantation may be commenced. Fig. 5 gives a good illustration of how this is done. Three-inch augur holes are bored in the sides of the vat, and these are fitted with plugs which are flush with the inside of the staves, so there will be no lodging places for slimes. As there is always more or less grass and rubbish with tailings treated, and these rise to the top of the agitator, a stick is laid across on top of the fluid near the edge of the vat, where the solution is to be drawn off, and before the first plug is pulled. This prevents other than the clear fluid flowing out, and also provides a clear spot at the side, so that when the decantation is near its close one can tell how near he is to the slimes. By proper arrangement of the holes and care in decanting, one can draw the fluid down until not more than half an inch of clear solution will remain in the vat.

FIG. 5.—DECANTING THE GOLD SOLUTION.

It is important to map out intelligently what one expects to accomplish in a decantation scheme. In other words, the proportion of fluid decanted determines in a measure the extraction. I have known persons to make two decantations of about 40% of the fluid contents of a vat and wonder why their tailings ran high and they were not able to make a good extraction. To make the matter plain, let us suppose we are treating an ore from which we are able to secure an extraction of $10. We have used one ton of solution to one ton of ore. Each ton of solution, therefore, will carry $10 in gold. We make a decantation of 40% of the total fluid in the vat. We have thus secured $4 and left $6. We make another decantation of 40%, taking out $2.40 and leaving $3 60. This latter amount goes out with the tailings, when most of it could have been saved. Suppose, again, our quantity of fluid had been regulated so that we could make decantations of 80%. In the first decantation we would take out $8, leaving $2. In the second decantation we would draw out $1.60 and leave 40 cents to pass out with the tailings. It will be apparent that one would save more money by making but one large decantation than by making three of 40% each.

On most material it will be found of advantage to use two washes, after the first or strong solution, to leave as little cyanide and gold as possible in the charge under treatment. Decantations of the solutions may run from 50% to 70%, but it should be remembered that when they are less than 50% one is leaving a percentage against himself. In the light of the above explanation, it will be seen that it will pay to take time to get a good percentage of the fluid at the first decantation, and that, on the contrary, the waiting of a number of hours for an extra inch or two on the decantation of the final wash may not be justified by what there is in it.

The speeding of a vat comes from so arranging matters that there will be no dragging in the decantations. If, during agitation, the surface of the contents of a vat presents a uniform appearance, the material has not been properly coagulated. The charge will settle if given time, but many hours' time will be needlessly wasted. With a small plant on low-grade tailings, this may mean a loss or a small margin of profit, when, by speeding the vat, the capacity of the plant could be practically doubled, with no additional cost for labor in running the mill, thus making the enterprise profitable. The surface of the vat at the close of agitation should present a mottled appearance, with alternating areas of clear fluid and organic matter. The practiced eye will detact a glassy appearance on the surface, if all is right, and the slimes will commence to go down before the fluid is at rest. Without this appearance and prompt action, it may safely be concluded that an insufficient quantity of lime has been used. The remedy is apparent. The use of other coagulants, such as soft soap, alum, soda, etc., has not been encouraging. Lime is the most effective as well as the most economical. The proper amount should be used at the beginning, as it is hard to successfully "doctor" a vat that does not go down as it should.

The skilled workman can devote his time to other matters while a vat is settling, knowing that he can decant very rapidly when the vat is ready by pulling a number of plugs at a time, as shown in illustration (Fig. 5).

When the final decantation has been completed, the plugs are replaced, the agitator is set in motion, thoroughly stirring up the contents of the vat, and then a plug, about 3x6 inches, at the lower end of the vat is drawn, allowing the tailings to pass out through tailings launder to such place as may be provided for them. The contents of the vat are thus discharged at the rate of about a ton a minute. The average time required for treating a vat, when making these decantations, is thirty hours.

The solutions decanted from the agitator pass to a gold vat. In this is a floating intake, consisting of a piece of rubber hose with outlet on lower edge of the vat through a faucet. The other end is attached to a float which rides the top of the fluid. To this is attached a screen to keep any rubbish from entering the extractor through the tube. The solution thus passes under uniform pressure to the zinc boxes, and such fluid as is drawn off is from the top and is therefore clearest of slimes and other impurities. In the earlier work the gold solution entered the extractor from a vat in which was a filter bottom covered with several inches of sand. This would work well for a time, but the accumulation of half an inch of slimes on top of the filter would effectually prevent percolation of the fluid, and the filter was abandoned for the simple expedient above described.

(To be Continued.)

THE discovery of large deposits of bauxite, which consists principally of alumina, in New South Wales, is of great scientific interest. Previously the mineral in question had been chiefly regarded as iron ore from the point of view of its iron contents. It now appears that it contains more oxide of aluminum than oxide of iron. Whether, however, the manufacture of aluminum on a large scale is likely to be immediately proceeded with is another matter. There has never been any difficulty in obtaining ample supplies of bauxite, which is of little more value in itself than limestone or pipeclay. The trouble is in the limited demand for aluminum itself, and the great cost of its manufacture. Demand is increasing, and the expense of production has been notably reduced of late years, and may still be made considerably smaller. Immense advance, however, will have to be made in these directions before the demand for bauxite begins to be in any way commensurate with the available supply.—Melbourne Standard.

Notes on Mine Sampling.

Written for the MINING AND SCIENTIFIC by GEO. J. BANCROFT.

Sampling a mine is simply a practical application of the doctrine of averages. A number of samples are taken on a vein, the average of which in width and value should represent the average width and value of the vein. The sole object of the engineer is to take such samples in such a manner that the assays of the different samples will form the basis of a correct estimate on the value of the mine.

The day of the expert who walks through a mine with a monocle in his eye, a compass in his hand and comes out and says in an impressive manner, "Gentlemen, this mine is worth so many thousands, so many hundreds, so many dollars and so many cents," is past. His day belonged to the golden past when all mining was considered a grand gamble. Modern science has taken mining from among the speculative ventures and placed it in the front rank of conservative industries. Engineers are recognizing more and more that it is almost criminal to recommend the expenditure of large sums of money on mining property without the most careful and painstaking investigation of all available information bearing on the value of the mine. With careful and intelligent engineering, mining ceases to be a gamble and becomes an industry in which the profits are as sure as in many other branches of industry, and are far greater in proportion to the capital invested.

There are several ways of sampling a mine. Some mines offer special facilities for treating large samples. The ore may be stripped for 6 or 8 inches deep over a section of the vein and the whole lot treated in the reduction works. This is very desirable if it is known just how much of the vein is ore, and if the expenses and time necessary are not prohibitive.

By far the most common method, and withal the most satisfactory, is the taking of comparatively small samples with a hammer and moil and sending each sample to a reliable assayer.

On page 633 are two illustrations showing the writer and assistant in the act of taking samples in this manner in the Independence mine at Cripple Creek.

The values in a vein are very apt to lie in strata parallel to the walls of the vein. Hence a sample should be taken across the vein, being careful to take an amount from each stratum proportional to its width.

The ideal sample would be taken just as a cheese sampler samples cheese. Of course, a vein of hard rock cannot be sampled in practice as one can sample a cheese, but if care is taken the sample will be sufficiently accurate for all practical purposes.

The important thing in sampling is to take the ore exactly as it is mined. There is always a tendency to take more of the soft than the hard. This is, of course, to be avoided, for the soft stuff generally runs higher, but sometimes lower, than the hard. In several camps, notably Cripple Creek and Kalgoorlie, W. A., "screenings" will pay to ship when the coarse rock is worthless. So the hard places in a vein must be patiently chipped off until the required amount is secured.

In regard to the width of the ore, a good deal of reliance has to be placed on the management of the mine, but an experienced engineer will often discover things about a mine of which the management is ignorant. I recall a mine in Cripple Creek which had been stoped for a width of 15 feet. The sampling proved that all the values were in about 2 feet of the 15, and that the rest was so low grade that it was inadvisable to take it out.

Veins that have ill-defined walls should be sampled into the walls a little way, for some of the wall rock is almost inevitably broken with the ore in mining. It is well to have a shot put into each wall every now and then, if the management has neglected it. A large ore body was discovered by the reporting engineer in a mine in the San Juan, Colo., by this simple precaution. The amount of ore to be taken per foot of width varies with the vein. In Bendigo, Australia, it is necessary to take about 10 pounds per foot of width, because the gold occurs in coarse particles and a small sample would be untrustworthy. Where the values are in fine particles and evenly distributed through the ore a small sample is as good as a large one. About 2 pounds per foot is enough in this case. Such veins as those of Gilpin county, Colo., or some of the veins on the mother lode of California may be sampled in this way. Where the values are coarser, or the vein "pockety," large samples should be taken.

The intervals at which samples should be taken vary, also, with the conditions. If an extremely accurate estimate is desired, as for a cash sale, and the vein is high grade, samples should be taken every 3 feet. In other cases 5 or even 10 feet will do. Between these limits the circumstances of the particular case must mould the procedure.

Samples should be taken on every exposed face of an ore body.

It should be borne in mind that it is customary for

miners to sink a winze or put an upraise in the richest part of an ore body. If this is found to have been done, the rich ore next the winze should be figured separately.

No part of the mine should remain unexplored. In an examination of a mine in Boulder county, Colo., a certain hole on the third level was regarded as a sump. In reality it was a winze connecting with an underhand stope from which $30,000 of ore had been removed, and the estimate of ore in sight was consequently very much too high. Of course, the most extreme caution must be taken throughout the entire examination to avoid the possibility of "salting," for, even if the owners are honest, one can never tell what influences may have been at work among the employes of the mine.

Each sample should be assayed separately and the result plotted on a map of the mine. In this way the size, strike and general habit of the ore shoots may be determined. In many cases the information gained in this way is of the greatest importance, and in every case there are sure to be facts enough developed to pay for the trouble.

The surroundings in general and the neighboring mines in particular should be carefully looked into for information bearing on the mine under examination. The possibilities of lawsuits should be carefully considered. It is not pleasant to look back upon a report which recommended the purchase of a lawsuit, no matter how good the showing was.

Once in a while the structure of the district will have a most important bearing on the value of a mine, as, for instance, the "contact" of Cripple Creek, the "indicators" of Ballarat, the "bluestone" of Kalgoorlie or the "great fault" of Cornwall.

The figuring out of the value of a block of ore from the data of the samples is a simple problem, but one that is often done wrongly. If a certain number of samples are taken on a block of ore the common method is to average the values and average the widths. This is obviously wrong, for two variables related as the values and widths of a number of samples cannot be averaged independently of each other and a correct result obtained; but this fact is often overlooked.

My attention was first called to the matter by T. A. Rickard of Colorado, and together we developed a method which we christened the foot-ounce method. Many engineers use the same or a similar method, but so far as I know a description of it has never been printed. In this method the value in ounces of each sample on a given block is multiplied by its width in feet, giving a product which we call foot-ounces. The sum of all the values in foot-ounces is then taken and the sum of all the widths in feet. Both sums are divided by the number of samples, giving the average value in foot-ounces and the average width in feet. The average value in foot-ounces is divided by the average width in feet, giving the average value in ounces. An example will illustrate. Let us consider three samples taken along a drift equal distances apart, as follows: (1) Twelve feet of ore averaging 1 ounce per ton; (2) 1 foot of ore averaging 12 ounces per ton; (3) 6 feet of ore averaging 3 ounces per ton. By the ordinary method we have an average width of $\frac{19}{3} = 6\frac{1}{3}$ feet, and an average value of $\frac{19}{3} = 5\frac{1}{3}$ ounces per ton. This is obviously wrong, as the bulk of the ore is only 1-ounce ore. By the foot-ounce method

12 feet	× 1 ounce	= 12 foot-ounces.
1 foot	× 12 ounces	= 12 foot-ounces.
6 feet	× 3 ounces	= 18 foot-ounces.
19		42

$\frac{19}{3} = 6\frac{1}{3}$ feet = average width in feet.

$\frac{42}{3} = 14$ foot-ounces = average value in foot-ounces.

$\frac{14}{6\frac{1}{3}} = 2.210526+$ = average value in ounces.

By the foot-ounce method, then, we have an average width of $6\frac{1}{3}$ feet and an average value of 2.21 + ounces per ton; by the ordinary method, $6\frac{1}{3}$ feet and $5\frac{1}{3}$ ounces per ton. This is an extreme case, but it serves to illustrate the error which may be made by figuring ore bodies in the ordinary way.

That this method is correct may be seen in the following way: Let us consider the block 30 feet long and 20 feet high, and let each sample represent a sub-block 10 feet long by 20 feet high by the width of the vein at the point where the sample was taken. Let us further suppose the mine is a gold mine, that gold is worth $20 per ounce, and that the ore is of such specific gravity that 15 cubic feet weigh one ton. Then sub-block 1 contains 160 tons of 1-ounce ore, having a total value of $3200; sub-block 2 contains $13\frac{1}{3}$ tons of 12-ounce ore, having a total value $3200; sub-block 3 contains 80 tons of 3-ounce ore, having a total value of $4800. Adding the totals, we find that the whole block contains $253\frac{1}{3}$ tons, having a total value of $11,200. By the foot-ounce method, $\frac{6\frac{1}{3} \times 30 \times 20}{15} = 253\frac{1}{3}$ tons, checking the above; $253\frac{1}{3}$ tons × 2.210526 ounces × $20 = $11,200, also checking the above.

Methods of Testing and Sampling Placer Deposits.*

By EDMUND B. KIRBY.

Every engineer who has had to do with placer work realizes how difficult it is to ascertain, even approximately, the average gold contents of gravel.

The problem presented often comprises gravel beds measured by hundreds of acres, or by miles of gulch bottom. The quantities which it is possible to use for actual tests, whether measured by panfuls or by thousands of cubic yards, are but a minute fraction of the great bulk. Moreover, the distribution of gold in this mass is irregular and uncertain to an extreme. From the nature of the deposit only small portions of it, at best, can be rich enough for pay. These local enrichments are due to the concentrating action of the stream at intervals during its long history. They are therefore subject to all the irregularities which might be expected from its ceaseless shifting, and the changes in the material deposited.

Notwithstanding these difficulties a business decision is called for, and it is always necessary to reach a sound conclusion without spending more time and money than the circumstances warrant. In most cases, therefore, it is best, if possible, to carry on the work by successive steps. If the general evidence examined proves satisfactory, it affords a basis for proceeding to the more simple and inexpensive tests. Encouragement from these will warrant more costly test workings, and the latter may be followed by the heavy and decisive work which is to settle the question at issue.

The Structure of Gravel Deposits.—In most cases presented throughout the West, the gold-bearing gravels are deposits from the present system of streams, and their form and position have probably been developed during the Quaternary period. The high gravels of the California ancient river system are of earlier date and form a class by themselves. As compared with the more recent deposits they are limited in quantity, and differ radically in structure, character of the gravel, grades and methods of working.

Only the first-mentioned deposits are under consideration here. They may be conveniently classed as "high bars" (above water level) and "bottom gravel" (at and below water level). The high bars are remnants of beds which were deposited before the stream cut down its gulch or valley to the present depth. They were originally terraced, but have frequently been shifted or changed in external shape by erosion. They were the most accessible and easily worked deposits, and, generally speaking, are now very scarce.

The deep gravel filling the present gulch or valley bottoms below water level constitutes the principal bulk of the deposits now remaining in every placer district. As a rule, it is inaccessable without the aid of skilled engineering, modern appliances and the use of considerable capital. Of late years these deep deposits have attracted some attention. This is on account of their abundance, and because of the possibilities which may follow their development. The uncertainties and difficulties of such work are very great. It has been best developed by "river mining" in California, and in various districts of the Northwest. During the last few years modern heavy machinery for excavating, hoisting and conveying has been brought into use for this work. Many mistakes have been made in its application, and most attempts of this kind have so far been financial failures. Steady progress is being made in perfecting such apparatus, and there is without question a large field for its application to cases where the conditions are suitable.

It is clear that the climatic and other conditions under which a stream cut down its channel in the bedrock were different from those which prevailed while gravel beds were deposited in this channel. In the first case there was a large volume of water and probably steep grades. In the second case both waterflow and grade must be less, and this is the condition which now prevails in our western rivers and streams. The present grades are generally less than 2%, and the transporting action on large gravel, even in time of freshet, has almost ceased. The bedrock is now protected from erosion by a more or less heavy bed of gravel, over the surface of which the stream flows. In many cases the processes of erosion and deposition have alternated frequently, and this accords with what is known of climatic changes during the Quaternary period.

The gravel beds are made up of various streaks or layers, some of which may be gold bearing, while others are entirely barren. These layers have all the irregularities of stream deposited gravel. They are sometimes quite uniform in thickness and value over considerable areas, as though spread out by floods. In other cases they form crescent-like, overlapping streaks, varying greatly in gold contents, and indicating their deposition in side bars by the stream as it shifted its position. During the deposition of gold-bearing gravel, the light or scale gold is apt to be distributed very uniformly throughout the entire mass. The heavy gold, on the other hand, tends to concentrate out in special streaks or layers. It is a frequent occurrence to find rich layers on top of barren layers, and many facts indicate that, during the deposition of rich gravel, its gold contents do not work down through undisturbed gravel beneath. When pay gravel exists in a gulch, it is generally confined to a ribbon-like layer on or near the bedrock. It is not likely that this is the accumulation of gold which has sifted down from the overlying mass. On the contrary, there is every reason to believe that the bedrock channel for a long period acted like a sluice. As the transporting power of the stream gradually lessened, its gravel was alternately moved and then redeposited. This sluice action, with the repeated shifting and loosening of the first deposits, caused their gold to accumulate in the bottom layers.

This pay lead or bedrock channel is usually of limited width, and meanders along the gulch, marking in general the course and width of the stream at the time. There may be two or more of these channels, and they are not necessarily in the deepest part of the gulch. They may be found higher up, along its sides, as portions of earlier channels, made before the bedrock of the gulch was cut down to its present depth. In such a channel the distribution of gold is very irregular, but, on the whole, it seems to follow the rule so often observed, and is heaviest on the inner sides of bends. It is usually necessary to work the channel by a pit or open cut. It is a rare occurrence to find that the general mass of gravel filling the gulch will average enough for pay. The slope required for the sides of the excavation increases the proportion of this poor gravel, so that the pay lead must be rich enough to bring up the average to the pay point.

Evidence Available in Placer Examinations.—A determination of the average value of gravel is only one of the numerous questions, both business and technical, which arise in a placer examination. It is often unnecessary, because the business decision to be made may be settled by other considerations. Moreover, the books and records of an established placer enterprise will often supply the data necessary to estimate the value of the ground worked. The reliance to be placed upon such evidence is matter for special judgment in each case. Generally, actual tests must be made, and the evidence to be secured may be roughly outlined as follows:

I. General evidence derived from the history, records, facts shown by prior workings and neighboring mines, structure of the deposit, etc., etc.

II. Evidence from sampling gravel already exposed. Such exposures may be found in surface gravel, natural banks and gullies, or prior workings.

III. Evidence from special test workings made for the purpose. These may include shafts down to water level, and such work may be made light or heavy as warranted by the circumstances and the facts developed during its progress.

IV. Evidence from heavy and decisive test workings. In high bars this may merely include a more extensive system of test shafts and drifts in the dry gravel, but in the water-bearing bottom gravel such work is very difficult and expensive. This should not be a serious objection, in view of the heavy investment which will be necessary to open and work a deposit of this character. The very existence of a pay channel, to say nothing of its grade, is uncertain. To risk a large investment on mere chance, without first feeling the way by such preliminary work, is not a course that will appeal to sound business judgment.

On account of the expense of testing gravel, it is impossible to cover a large territory. In practice, all that can be done usually is to select the most promising and workable locality, and decide the question at issue by the value of this portion. The test workings should be so arranged as to define the shape and limits of the pay ground. In a large area or a thick mass, there is no better system than a number of shafts. A channel may be exposed by a crosscut drift from a shaft, and a few cross sections of this kind at different points should give a fair idea of what may be expected from it. Bottom gravel may be 500 to 1500 feet wide, and the main difficulty at first is to locate the position of the bedrock channel. It will generally be best to secure some evidence on this point before starting a shaft. There is no better way of obtaining this than by a line of drop drill holes which will give an approximate cross profile of the bedrock, and will also give some evidence as to the presence of gold and the character of the gravel.

The units of measurement used for placer gravel vary according to the shape of the workable ground. In a thick mass it is the cubic yard. In a thin sheet, with the values on the bedrock, it is customary to use a unit of area such as the claim or the acre. For a channel, a unit of length is preferred, giving the yield per 100 or 1000 feet of length. The extreme irregularities of the deposit are always to be kept in mind, and figures of measurement (like those of value) are to be used with caution. In averaging the results of tests, each should be given a value proportioned to the volume of gravel which it is supposed to represent.

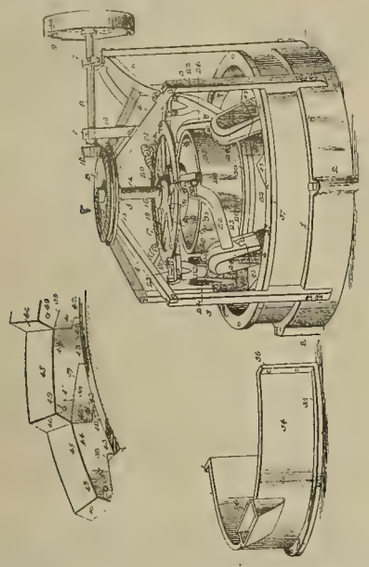
Latest Mining and Metallurgical Patents.

Patents Issued June 6, 1899.

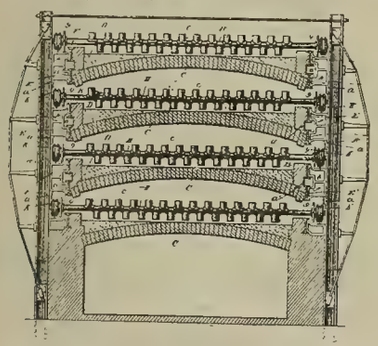
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ORE CRUSHER.—No. 626,326; J. F. Keyton, Baker City, Or.



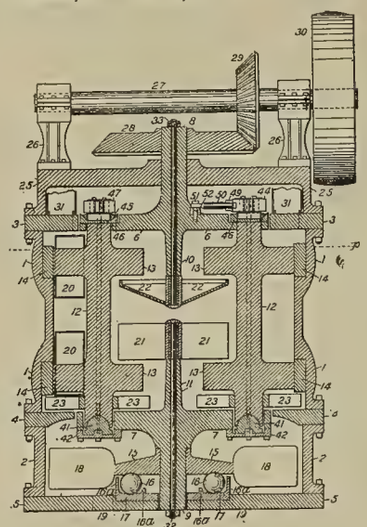
An ore crusher, the combination of a drag wheel involving a hub provided with slots, arms fitted into slots, an annular band or brace attached to arms, the arms being bent or deflected outside the brace, drag arms jointed to deflected projections, and stamps or mullers; the mortar having enlargements with recesses between them to form seats, and a groove at lower portion of one end of each recess, and dies removably fitted over the enlargement and having an under contour corresponding thereto and the recesses between same, and also provided with tenons to engage the grooves.

HEATING OR ROASTING FURNACE.—No. 626,632; W. E. Roberts, Butte, Mont.



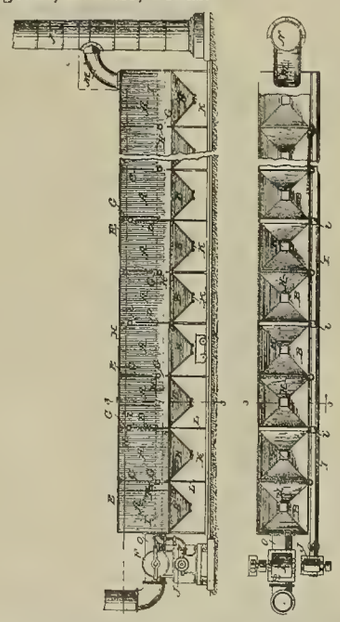
A calcining furnace comprising a series of vertical or upright posts between the ends of the furnace and at suitable localities to insure the strength of the structure, brackets carried by posts, longitudinal I-beams carried by the inner ends of brackets, and distant from posts, an arch of masonry carried by the I-beams, side walls and hearth carried by suitable supports, longitudinal continuous slots through the side walls, and extending from end to end thereof and past the vertical posts, and means for closing longitudinal slots when desired, substantially as described; a series of sets of arches, hearths and side walls of masonry carried by the longitudinal I-beams, each set of arches, hearths and side walls separated from the next adjacent set by longitudinal slots extending laterally from the heating chamber and into the open space between the side walls and the vertically arranged posts, whereby the entire masonry of the furnace may be carried by supports lateral to the side walls and heating chambers and access be had to the heating chambers from one end to the other; furnace composed of a series of ovens or heating chambers one above another, the combination with vertical supports ranged alongside the walls, of horizontal longitudinally disposed beams supporting the roof or arch of one oven, the floor of the next above and the side walls, and brackets carried by the vertical beams and engaging and supporting the horizontal beams; separate longitudinal beams one above another of differing weight and strength, the lower and heavier supporting the roof or arch of one oven and the upper and lighter the floor of the next oven above, in combination with vertical beams or columns ranged along the side walls of the furnace and brackets carried by the vertical beams engaging and supporting the horizontal beams; longitudinal tracks on brackets, continuous longitudinal openings through both side walls and extending past the columns, a rake, the ends of the shaft of which project through the longitudinal openings of the walls of the heating chamber and supports for shaft ends outside the walls of the heating chamber, but within the columns, and resting on tracks for supporting and operating the rake.

CENTRIFUGAL PULVERIZING MILL.—No. 626,426; F. G. Johnson, New York, N. Y.



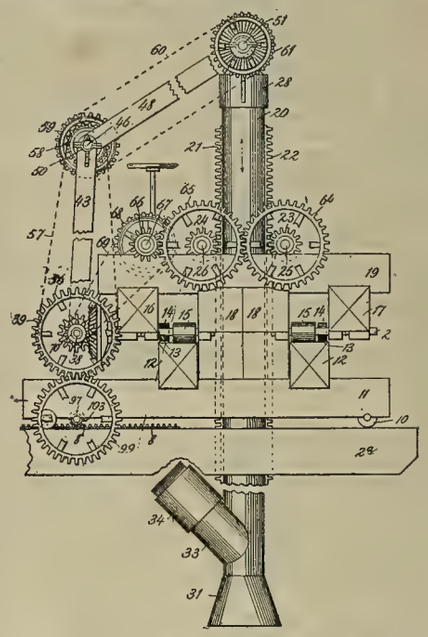
A centrifugal pulverizing mill, two or more vertical roller shafts, each of the same having two horizontal rollers, the upper and lower roller shafts holding headplates *6* and *7* rigidly held together by coupling bars, and each headplate having a central spindle shaft extending toward each other, the lower one of which having mounted thereon a series of radial fanblades, and the upper one of the spindle shafts having mounted thereon an upturned concave disk having vertical radiating partitions, in combination with an inclosing case having annular dies for the tread of the rollers; an upper inclosing case having annular dies for the tread of the said rollers and a lower case having within it an automatic blower mounted on the lower main shaft; the roller shafts having their horizontal support and propulsion in the direction of their circuit around the common center of motion by swivel connecting rods, the movable swivel ends of the rods being secured to the journal boxes of the roller shafts and the fixed ends thereof to the headplates, in combination with a surrounding case having annular dies for the tread of the roller; whereby the roller shafts are immovably held in a vertical position in the direction of their circuit around the common center of motion and yet are free to move and lean in a radial direction.

APPARATUS FOR CATCHING WASTE PRODUCTS FROM LEAD, SILVER OR OTHER SMELTERS.—No. 626,569; W. Sergeant, El Paso, Texas.



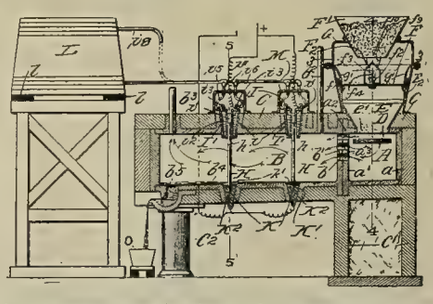
An apparatus for catching the waste product from smelters consisting of the trail or passage composed of settling chambers arranged in succession and having hopper-shaped bottom, baffle plates extending alternately up and down between settling chambers, the transverse air spray pipes extending adjacent to the free edges of the baffle plates, the exhaust fan for forcing the fumes and waste products through the trail or passage, the air main and fan for forcing the air through such main and connections between main and air spray pipes; longitudinally extended trail or passage for the fumes, transverse baffle plates alternately arranged therein and having narrow passages alongside their free edges and the transverse air spray pipes extending adjacent to the free edges of the baffle plates; standards whereby settling chambers are held in an elevated position, the alternately arranged baffle plates partially separating the chambers, the transverse air spray pipes located between the settling chambers and the main connected with pipes.

DREDGE FOR HARD OR SOFT MUD.—No. 626,491; J. T. Ford, Galveston, Tex.



A dredging machine, the combination with a support having an overhanging frame, of a main carriage movable on frame toward and away from the support, a supplemental carriage movable back and forth on the main carriage at an angle to the path of movement of the latter, a vertically movable suction pipe, transverse parallel bars on the supplemental carriage for supporting the suction pipe laterally, and a brake device supported by the bars for controlling the descent of the suction pipe; combination of a stationary support, the drive wheel (*85*) located thereon, a movable carriage for supporting the working parts, the shaft (*33*) mounted on the carriage and carrying the wheel (*96*), the idler arranged in fixed relation to the drivewheel, the movable gear (*91*), and drivechain (*92*), the shaft (*97*) supported by the carriage, and shiftable connection between shafts for reversing the movements of carriage; a vertically-adjustable suction pipe, a gear rack on the same, a pinion meshing with rack, and a brake on the shaft of the pinion to control the descent of the pipe.

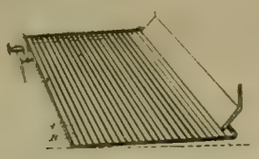
PROCESS OF REDUCING ALUMINUM FROM ITS COMPOUNDS.—No. 626,635; G. Schwahn, St. Louis, Mo.



As a process, subjecting a hot compound vapor containing aluminum to the action of a hot carbon-gas deoxidizer, in the presence of incandescent carbon, for an appreciable length of time, substantially excluding the air; as a process, passing a compound vapor containing aluminum through a chamber from which air is substantially excluded, and which contains incandescent carbon at two or more points between its ends, causing vapor to pass in the neighborhood of incandescent carbon repeatedly during its passage through chamber, subjecting vapor during its passage to the action of a hot carbon-gas deoxidizer for an appreciable length of time, and increasing the heat of vapor during its progress through chamber and while being acted upon by gas, until its temperature is not lower than that of carbon at a white heat; subjecting an aluminous vapor substantially free from silica, any alkali or any metal adapted to alloy aluminum, to the action of a carbon-gas deoxidizer and incandescent carbon substantially

free from silica, alkali or any metal adapted to alloy aluminum for an appreciable length of time, while substantially excluding the air.

CONCENTRATING BELT.—No. 626,461; G. Gates, Jackson, Cal.



An endless traveling belt having a regular general inclination so that pulp delivered at the upper end will flow toward the lower end; broad, flat tubular surfaces at the top of the belt with intervening offsets, each of surfaces declining toward the higher end of the belt and to the foot of the next offset, whereby extended surfaces are formed for the settling of sulphurets and to allow pulp to flow over the surface of the sulphurets thus deposited; an endless, longitudinally inclined belt composed of a series of wide, longitudinally disposed surfaces with shallow, vertical connecting offsets, drums around which the belt is movable, both drums so inclined from end to end that the belt surfaces have a slight downward inclination transversely from the lower toward the upper edge of the belt, and a means for supplying pulp and water along the upper edge of belt; belt having upturned flanges at its edges, drums around which the belt is movable, being inclined transversely of the belt, so as to produce a general flow of pulp from the upper side and end, while the belt surfaces decline from the lower end toward the upper side.

Some Rare Mineral Specimens.

The following recent additions have been made to the exhibit of the California State Mining Bureau in the Union Depot and Ferry House:

Strontianite (carbonate of strontium), Lassen Co., Cal., H. G. Staab; first occurrence of this mineral noted in California.

Crednerite (oxide of copper and manganese), H. C. Davey, Calistoga, Cal.; first occurrence of this mineral noted in California.

Silver ore (stalactite) assaying 140 ounces silver per ton, Esmeralda mine, near the San Marcos coal fields, Sonora, Mexico, Prof. E. T. Dumble.

Hydro-boracite (borate of lime and magnesia) containing 50% of boracic acid, Ventura Co., Cal., J. Ryan; first occurrence of this mineral noted in California.

Meteoric iron; cutting from the Roebourne meteor, found in N. W. Australia, beautifully etched by Prof. H. A. Ward.

Kermesite (oxysulphide of antimony), from near Mojave, Kern Co., Cal., H. E. Cunningham; first occurrence of this mineral noted in California.

Quicksilver ore from near Clayton, Contra Costa Co., Cal., Dr. Wm. Rider Powell.

Petrified wood from the stump of a tree in Humboldt county, the body of which was worked up into shingles, R. F. Herrick.

Gold quartz, Gold Bug mine, Josephine Co., Oregon, J. D. Ludwig.

Gold in chlorite, New South Wales.

Chrysocolla (silicate of copper), Copper World mine, Ivanpah, San Bernardino Co., Cal., Herbert Lang.

Cinnabar (concentrates from soft ore), Integral mine, Trinity Co., Cal., A. B. McCaw, M. E.

Gold quartz, showing free gold, from a ledge 4 to 5 feet wide near Colville, Mono Co., Cal., Martin H. Shields.

Gold and silver ores from Moore Hill mine, near Cathay, Mariposa Co., Cal., Walter Mayerhofer.

Antimony ore (stibnite), Metallic mine, twenty-four miles from Mojave, Kern Co., Cal., W. A. Johnson, per A. Blanc.

Hubnerite (tungstate of manganese), Runnelville, Cochise Co., Arizona, Prof. Wm. P. Blake.

Rich quicksilver ore, Bryan & Sisk mine, Clover creek, Shasta Co., Cal., J. M. Bryan.

A large number of gold quartz specimens from Calaveras, El Dorado and Placer counties.

Gold quartz, Golden Jubilee mine, Trinity Center, Trinity Co., Cal.; 460 pounds of this rock yielded $220.64 gold and silver.

H. S. DURDEN,
Curator.

A NOVEL method of saving gold from tailings, says the *South African Mining Journal*, consists in the employment of a funnel-shaped vessel, with the small end downwards, in which a quantity of water is placed, with a layer of kerosene on top of it. The tailings are put in from above, half a ton at a time, and the agitation of the fluids causes the separation of the gold, which, for some unexplained reason, takes up a position in suspension between the kerosene and the water. A. W. Howitt, late Secretary for Mines in Victoria, vouches for the correctness of the description, his son and a Mr. Godfrey being the patentees. H. C. Jenkins, A.R.S.M., and Mr. Meekinson, the metallurgist and engineer respectively of the Mines Department, have been instructed to investigate and report on this process.

Some Experiences of a Working Miner.

NUMBER XX.

Written for the MINING AND SCIENTIFIC PRESS.

The G—— G—— M—— Co. was a corporation and had an abundance of money, apparently, for speculative purposes, but there appeared to be a dearth of mining talent and a lack of common sense in the outfit. Evidently realizing the shortcomings of the concern, they employed at no small expense a certain Madame B——, whose specialty was divining the whereabouts of rich veins and deposits of gold and other ores, and on a pinch she could make a pretty good bluff at metallurgy and mechanical engineering.

After the company was organized and ready for business Madame took a hand and a large deposit of gravel on C—— creek was investigated; this was found to be very rich in gold, much to the surprise of those who lived in the neighborhood, who had never suspected that the gravel was gold bearing, but Madame went into a trance and, coming out of it alive, positively asserted that the spirit of a departed Indian chief, who had in life inhabited the section where the gravel was found, had told her there were great riches in the bank of gravel. The deposit lay 60 feet or more above the creek bottom and it was apparent the only economical way to work the deposit was by the hydraulic method. This necessitated a ditch. There was plenty of money and a ditch was built five miles in length, but in fear that there would not be sufficient water in this ditch, a second one was dug on the opposite side of the canyon. This was also about five miles long. The two ditches were finally completed and flumes arranged, several hundred feet of iron pipe laid and a full equipment for hydraulic mining put in, and at last the giants were turned on the gravel bank. Piping was kept up night and day for a week and then the water was shut off for a clean-up, to get an idea of how the thing was going. The clean-up showed several panfuls of fine, nicely washed iron rock, and a few hundred specks of gold—perhaps twenty cents in all. About this time Madame B—— had another spell and, as before, surviving it, declared that the chief had not been sufficiently plain in his description of the wealth on C—— creek. It was not in the gravel deposit at all, but in veins of silver-copper ore. A score of quartz locations were made, and open cuts, shallow shafts and tunnels were made, some of the latter nearly 100 feet in length. Not one of these developed anything. The Madame then denounced the chief as a deceiver and rousted out some other kind of a spirit who told her that on a certain hill near D—— there was a rich mine, but no one could treat the ore unless the secret were learned from the aforesaid spirit. The ground pointed out was located and considerable work done. The Madame managed in some manner to get big assays from any of the rock, but somehow the assayers who did a commercial business at D—— could not get anything out of this rich ore. The spirit came to the rescue, however, and told Madame how to build a mill to treat this peculiar ore, and the mill was actually built. It had a single steam stamp with a cylindrical screen. Below were half a dozen shallow pans, each about 8 inches in depth. There were settling vats, and roasters, pulverizers, and I cannot remember what all. It cost over $20,000 and never worked but three or four tons of ore and that contained nothing, and this failure wound up the G—— Co. which had spent over $75,000 on the advice of spiritual miners and had gone broke.

* * *

One can work very close to a lot of gold underground and miss it by an inch or two. Several years ago when the original owners were working the B—— mine it became necessary to cut a hitch in the foot wall, or rather what they called the foot wall, for the purpose of setting in a post. The hitch was cut and a very fair prospect uncovered. That is, some of the pieces of rock chipped out showed a little gold, but it was a mere nothing as compared with what had been taken out a short distance above, and it was looked upon as a sort of small offshoot from the main vein. Years after, when other men were working the mine, they were taking up this foot wall ground, and when they came to the old post it had to come out. It was removed and the rock under it was also cut out, and within a space of not over 100 square feet under and about the post nearly $100,000 was taken out in a few days. The first miners had the prospect but did not follow it.

* * *

Tenderfeet had worked the B—— B—— mine with very indifferent success, and having exhausted their means and having realized very little from the mine went in search of assistance. They found a man after a short time who agreed to put up a grubstake and work himself, being a miner, for an equal interest. When he arrived at the mine and went to the bottom of the inclined shaft, about 30 feet deep, he remarked that the hole was too small to work in and suggested putting a hole in the hanging wall for the purpose of cutting out more ground. Here comes the element of luck, for it was nothing else. One of the original owners thought the hole should be placed on the foot wall side as it would be easier drilling. The new partner made no objection and the hole was drilled into the foot, charged and fired. After a time one of them went down to see the effect of the shot. He had hardly reached the bottom when he called out to those on the surface, "Come down here; gold till you can't rest!" The men above tumbled over each other in their haste to get to the bottom of the hole, and there, sure enough, was gold and apparently plenty of it, and they scarcely rested for several days till they had taken it out, breaking out the floor of the inclined shaft nearly to the surface and getting about $15,000 for their labor. The first two had worked right over the rich streak, within 6 inches to 1 foot of it all the way down.

* * *

Mr. A—— was a well-to-do business man; not rich, but very comfortably provided with this world's collateral. He took the notion to abandon business and to engage in mining. He went to C—— and made his first venture, and it was successful. A few months' work had swelled his capital 50%. His fortunate experience also swelled his head and after six months' experience he concluded mining was the simplest, easiest and withal the most pleasant way of making money. The latter portion of his conclusion was correct, all right, but when it is classed as the simplest and easiest, he who thinks so without having learned so from his own experience had better hesitate. A——, besides being well off and successful, was also obstinate and hard-headed. Having once determined in his own mind to do a certain thing no amount of dissuasion could turn him from his purpose. He was also a scholar and a firm believer in the principles and laws of nature. Near the bar from which A—— had taken a goodly sum in placer gold was a deep hole in the river. This was commonly known as the pot hole. Now, A—— argued: "As that hole is the deepest part of the stream and gold is probably the heaviest substance in the stream, and as the stream has been rich elsewhere, the pot hole must have caught and retained a large amount of gold, for the gold in the stream above the pot hole is distributed for miles along its course, and it is simply a rational conclusion to believe that a large amount of gold has gone into that pot hole and having gotten into it it could not possibly get out." Many others had reasoned in the same manner before about other pot holes to their sorrow. Old and experienced miners told A—— he could get nothing from the pot holes, but he turned a deaf ear to all advice and told them the reason they had failed was from not knowing how to go about it. It was an inexorable law of nature that the gold should seek the lowest places, etc. He went to great expense, built pontoon bridges and had about exhausted his means when ready to reap his reward. Is is scarcely necessary to say what the result proved to be; briefly told, it was no gold. This experiment ruined A—— financially and it really cost him his life, for he was not a strong man physically and the loss of his money brought on illness to which he succumbed. It is simply another illustration of how easily a novice at mining may overestimate his knowledge and capacity to handle a novel proposition.

MINER.

Deep Mining on the Rand.

So far as the first row of deeps is concerned deep level mining on the Rand has, under careful and skillful management, proved an unqualified success, and the time is fast approaching when the second row all along the line will enter the ranks of producers and swell the output and the dividend list. The success achieved has caused renewed inquiry as to the possible depth to which mining on the Witwatersrand bankets may be practically and profitably pursued. Mr. John Hays Hammond long ago gave his opinion that 5000 feet was a reasonable depth to expect to attain both practically and on a commercial basis. Mr. Hammond estimated "that in the case of a deep level mine of 250 claims and with two shafts, each 2500 feet deep, the extra capital which would be required to pay for the sinking and equipment of such shafts would be about £800 per claim." Truscott gives the average profits per claim on the outcrop companies at £31,700, and this is now being exceeded in actual results, £45,000 per claim being nearer the actual earnings. He estimates the extra cost of hauling from 2500 feet to be about 3s 3d per ton, so that, allowing for both factors of increased expense, viz., shaft sinking and haulage, the margin of profit is affected only in a very small degree. For depths of from 2500 to 5000 feet it would seem that an estimate of costs would have to be proportionately increased, but hitherto every year the cost of mining has been reduced, and the probability is that by the time the mines containing the reef at a depth of 5000 feet reach the producing stage their working cost will be much higher than those of the deeper producing mines are to-day.

Shaft sinking is already being done much more rapidly, and new methods and discoveries are constantly being introduced which will have a most important bearing in the future of deep levels.

Diamond and Gold Mining in Minas Geraes, Brazil.

The following interesting description of the diamond and gold mines of Brazil and the methods of working them is from the report of Mr. Dawson, secretary of the United States Legation in Brazil:

Minas Geraes is the most populous State in Brazil. It has 3,000,000 or 4,000,000 inhabitants and its area is about 222,000 square miles. On account of its elevation, the climate is for the most part cool, temperate and healthy. There is no winter in the ordinary sense of the word. The surface is a great plateau with a general height of 2000 to 4000 feet above the sea. It is varied by an extensive river system and mountain chains, the latter rarely reaching an elevation of more than 6000 feet. In the southern part of the State are several lines of railway; coffee is largely exported; immigration has been considerable, and the commercial relations resemble those of the neighboring States, Sao Paulo and Rio de Janeiro. The northern part, including four-fifths of the area, is without railways and is more isolated, self-supporting and characteristically Brazilian. In this region are found the diamond mines. It contains a large population and is one of the most prosperous parts of Brazil.

In mining, Minas is pre-eminent among the States of the Republic. It has produced and still produces by far the largest proportion of the mineral output of the country.

Diamantina lies 680 miles from Rio de Janeiro, and has from 6000 to 8000 inhabitants. As its name indicates, it is the capital and center of the principal diamond district of Brazil. It was founded in the last years of the seventeenth century as a gold mining camp; in 1729 diamonds were discovered. These were at once declared State property by the King of Portugal, and for a hundred years mining of diamonds in Brazil was a Government monopoly. In 1832 the Brazilian Government legalized private mining. Before that time the Government superintendents and contractors had worked the mines with gangs of imported slaves and in a most short-sighted manner. The district shows the indelible results of such a regime. To this day, there is an enormous preponderance of negro blood, and immense deposits of diamond-bearing gravel are irrecoverably lost, because they have been covered with detritus of other workings.

There are six important diamond districts in Brazil:

(1) Diamantina.

(2) Grao Mogul, also in the State of Minas and 150 miles from Diamantina.

(3) The Chapada Diamantina in the State of Bahia, which produces quantities of amorphous and black diamonds, used for making drills.

(4) Bagagem, 200 miles south and west of Diamantina. This was worked as early as the middle of the last century and produced the celebrated Estrella do Sulof, 254 carats; but the general results were unsatisfactory as compared with those of Diamantina and Grao Mogul. The district has been but imperfectly explored.

(5) Goyaz, in the State of the same name, near the River Araguaya, a navigable tributary of the Amazon.

(6) Matto Grosso, 100 miles north of Cuyaba, the capital of the State, and 1000 miles west of Rio de Janeiro.

The first three districts lie on or near the crest of the great mountain chain of the Sierra de Espinhaco, or its continuation under different names, which forms the watershed between the Sao Francisco, flowing north more than 1000 miles before it turns toward the Atlantic, and those rivers which flow directly into the ocean between Rio de Janeiro and Bahia. It is the opinion of experts that these three diamond districts are all parts of a great diamondiferous region extending in a narrow belt along the crest of the sierra and down its slopes for more than 500 miles. It is therefore probable that further discoveries may be expected in the intervals between the districts already productive. That in the vicinity of Diamantina the country rock, from which the diamonds have been washed by erosion into the beds of streams, exists only in the central sierra and not in the side mountain chains, is proved by the fact that diamonds have been found in all, or nearly all, of the streams which flow into the left side of the Jequitinhonha, and none in those flowing into the right bank. The Jequitinhonha is the most famous of all the diamond rivers, and the most extensive and successful operations in Brazilian diamond mining have been conducted in it and its upper tributaries.

Four distinct kinds of mining are practiced in the Diamantina district. The first is the most ancient and simplest. Near the top of the sierra the small streams are very steep in their descent and have precipitous rocky sides. Their beds are filled with boulders, and in the interstices the diamond-bearing gravel is found. This gravel is called the "formacao," and is easily recognized by an experienced miner, for the reason that it contains certain minerals whose presence indicates the diamond. The diamond is a heavy mineral, its specific gravity being about 3.6, much greater than that of ordinary rock. When the original deposits in the high sierra were eroded and washed into the streams, the diamonds and other heavy minerals were separated from the bulk of the detritus by the action of the water. The heavy gravel thus left at the bottom and caught among the boulders is the formacao. There are more than thirty minerals, some of which are always found in it. Among them are tourmaline, specular ore, disthene, rutile, gold and various phosphates. The presence of these shows that the existence of the diamond among them is probable. The formacao is prospected for in the dry season, and as soon as found is dug out and piled near by the water. When the rains interrupt the digging, the miners work up the gravel. The operation is very simple. The gravel is first washed in a "bacu," an excavation a yard wide and a yard and a half long on the bank of a pond or stream. Its lip is a few inches above the surface of the water and it deepens slightly to the rear. A cubic foot or more of gravel is placed in the back end and the workman dashes water against it out of a large concave wooden plate, giving it a peculiar rotary fling. This rapidly separates the lighter and larger stones from the smaller and heavier ones. When concentration by this rough method is as complete as possible, the gravel is worked with the "batea," a wooden dish about 30 inches in diameter, with a sort of pit at the bottom. Filling the batea with the concentrate and water, the workman agitates the contents, whirling and shaking them, meanwhile pouring and scraping the lighter gravel from the top as fast as he separates it. The operation is similar to gold-panning, but requires greater skill. It is said that a man may be a first-rate gold-panner and yet useless for diamond washing. At the end of the process, the diamonds are simply picked out by hand from the remaining minerals. Their peculiar luster makes them easily recognizable even by a tyro. The Brazilian method of washing alluvial gold is substantially that described above. By its use, practically all the diamonds and placer gold which Brazil has produced have been obtained. The native Diamantina miners know no better method.

At present the small stream washings in the Diamantina district are not important or productive. Two hundred years of search has exhausted most of them. Those who work them are usually men with little or no capital. They go in small parties and work somewhat at random, trusting to the chance of finding virgin gravel and making a rich haul. The rewashing of ancient concentrates of the old workings is also extensively pursued.

The second method of mining is that practiced in the beds of the larger streams. The opening of one of these mines is an extensive and complicated undertaking, requiring the employment of thousands of dollars and hundreds of men. At the beginning of the dry season a spot is selected which is believed from tradition or ancient documents to be virgin. Just above the spot selected a rude dam is erected and also a sluice around it, through which the waters of the river are turned. The bed thus exposed is usually found to be of sand, largely the detritus of ancient workings. This sand is carried out a shovelful at a time in little wooden pans on the tops of negroes' heads. Naturally, such a process is tedious and expensive. The work could be done many times more cheaply and quickly with dumpcarts or even with wheelbarrows. From time to time attempts have been made to introduce them; but they have not been successful, owing to the conservatism of the native miners. The excavation is often carried to a depth of 30 or 40 feet before bedrock, where the formacao is to be found, is reached. The hundreds of workmen climbing the slopes of the hole in long lines, each balancing a pan of earth upon his head, look like ants following their paths in and out of a hill. The work is done in great haste, because the first considerable rains in September or October wash away the whole structure and fill up the excavation. The water that percolates into the pit is pumped out with rude pumps worked by overshot wheels, a portion of the river being diverted from the sluice for this purpose. These pumps are simply wooden tubes, in which work leather buckets opening upward. A stream of water is kept continually pouring down from the top to keep them running, otherwise they would not draw. The construction of the sluice, dams and wheels shows considerable primitive engineering skill. No nails or iron are used. The joints are mortised or bound together with vines. The builders have no idea of exact measurements, even the slope of the sluice being determined by the eye alone. Nevertheless, such is their inherent skill that their work nearly always serves its purpose. However, they are unequal to difficult and novel problems. For example, one famous spot in the Jequitinhonha called the Pocao (pothole) de Moreira, reputed to be virgin and fabulously rich, was unsuccessfully attempted several times in the early part of this century. Every time before the bottom was reached the rains came and destroyed what had been done. A few years ago Antonio de Lavandeyra, a Cuban engineer, by the use of modern methods and pumps, succeeded in reaching and uncovering the bedrock. The practical results were a good example of the discouraging uncertainty of diamond mining. Only four diamonds were found. It is now believed that one of the early contractors, in the good old days before the formacao in the Jequitinhonha had been covered up with sand, had exposed or dredged the spot and taken out all the diamonds, and then had not thought it necessary to make any record of his doings for the Government or posterity.

The whole bed of this richest of all diamond rivers, from its source to Mendanha, fifty miles below, has probably been worked. Below that point the valley is too broad and the bed too much choked with sand to permit operations of the kind I have just been describing.

The gravel found is carried out of the excavation and placed in piles until the enforced leisure of the wet season gives a convenient opportunity to wash it. If the ground is virgin, the miners are likely to get a rich reward; if the gravel has been washed before, they lose all they have spent. The river mining is usually carried on by a local expert, who forms a company, to which his speculative neighbors and friends subscribe. No foreign capital is employed in it.

(*To be Continued.*)

White Rock Silver Mine.

The White Rock silver mine, near Drake, New South Wales, which at one time was floated for a million sterling, has been the despair of numerous plucky prospectors. Though it has not returned a profit on the capital expended, it is of great geological interest. E. F. Pittman, the Government geologist of New South Wales, visited the mine. "The White Rock deposit," he says, "has hitherto been regarded as a felsite dyke, intersected by veins of silver-bearing galena and zinc blende. I had never had an opportunity of inspecting it until recently, when I spent several hours in examining the deposit, which appears to me of such an unusual and interesting character that I determined to pay it a second visit during the Easter holidays. In my opinion, the argentiferous material is a volcanic agglomerate or breccia, and forms the filling of a volcanic neck or chimney.

"The agglomerate, which is of a greyish-white color, consists essentially of felsite, and contains numerous rounded and sub-angular boulders, many of which show rhyolitic structure; they vary in size from that of a pea or less up to several feet in diameter. This agglomerate is intersected by numerous minute veins of galena and zinc blende, which in places impart to it the character of a stockwork, while occasionally larger banded veins up to 2 feet in width are seen striking in various directions. These consist of quartz, with galena, zinc blende, pyrites, native silver, ruby silver ore, calcite and chalybeate. The agglomerate has been much silicified by the infiltration of mineral solutions from below, and is extremely hard and tough.

"In form the mass of ore is rudely circular, or rather cylindrical, its diameter being probably about 600 feet, though it is not possible to exactly define its limits, on account of its surface being in places covered by soil. It occupies the floor or center of a circular horse-shoe-shaped valley, the walls of which rise with a regular and rather steep inclination to a height of from 200 feet to 600 feet above it, and are quite isolated from the surrounding mountains. The rock of which these walls are composed is a dark grey felsitic lava, which in one place was observed to have a columnar structure, the columns being vertical.

"The valley has only one opening, which probably represents a breach in the old volcanic cone, and through this opening the White Rock creek, which rises within the circular valley, flows towards Fairfield creek. The diameter of the crater from rim to rim is probably rather more than half a mile. The altitude of the White Rock is about 550 feet above the town of Drake, and the altitude of the highest part of the rim of the crater is about 600 feet more. There is every reason to believe, therefore, that this is the point of eruption from which all the lava and felsite breccias, which have long been known to occur in the vicinity of Drake, were derived.

"The White Rock ore deposit has been worked by an open cut having a length of 150 feet, a height of 70 feet, and a mean width of 30 feet. In addition to this a vertical shaft has been sunk to a depth of 186 feet, and drives of 100 feet and 140 feet have been put in to the north and south at the 180-foot level.

"The geological mode of occurrence of this deposit appears to me to be of peculiar interest, more particularly as there are, so far as I am aware, only two analogous metalliferous deposits known in the world. These are the Bull Domingo and Bassick mines, Colorado."—Melbourne Standard.

THE announcement recently made by the Geological Survey that the coal product of the United States in 1898 was 219,036,000 short tons against 226,287,000 for Great Britain shows that the United States is rapidly gaining upon that country as a coal producer and will soon become the leading coal-producing nation of the world. As an exporter of coal, however, the United States takes low rank in proportion to its production, and stands fourth in the list of coal-exporting countries.

Filter-Press Process of Gold Ore Slimes.*

By WILLIAM MCNEILL.

Various processes have been tried for treating that part of the tailings from stamp-mill treatment known as slimes, which are usually separated from the tailings, to be treated by cyaniding. The difficulty in treating these eliminated slimes is generally admitted to be chiefly mechanical, the gold being in a finely divided and easily soluble state. In the Transvaal the lime or coagulation process has been attended with marked success. Briefly described this process consists in the coagulation of the slimy particles by the addition of lime, settlement of the flocculent precipitate and treatment by weak cyanide solutions which are decanted after settlement. The slimes after decantation contain about 50% of their weight of cyanide solution, which is partly removed by dilution with weaker solutions. It will therefore be seen that this method requires a large amount of solution compared with the ordinary percolation cyanide process, and even with the use of successive weaker washes still leaves in the slimes 50% of their weight of weak cyanide solution, which must necessarily contain a certain percentage of gold.

The coagulation process followed by decantation, as above described, has proved itself an economic success for slimes which are not very rich, and where water is fairly plentiful. The conditions are, however, different on most of the West Australian gold fields, where water is not abundant, and where the talcose, clayey nature of the ores of the oxidized zones renders it impossible to crush them either by a wet or dry process without the production of a large percentage of rich slimes, in many cases carrying as much as one ounce gold per ton of ore.

C. A. Moreing was one of the first to consider the best and most economical method for treating slimes, more especially those resulting from the crushing of West Australian ores. The author does not contend that the coagulation process followed by decantation could not be used with more or less success upon the ores of the character met with in West Australia, but is of opinion that the elimination of the dust or slime particles, and the treatment of the same in the filter-press plant described below, offers in the case of Kalgoorlie and similar ores special advantages. In many cases the author believes that filter presses might be advantageously substituted for decantation methods. Considering the large number of industries successfully using filter presses for dealing with precipitates of a slimy nature which cannot be filtered by the ordinary percolation methods, even when the withdrawal of the liquid is assisted by a vacuum beneath the filter, it might have been anticipated that these appliances would have been more largely adopted for dealing with gold ore slimes than has hitherto been the case. Several previous attempts have been made to employ filter presses for this purpose, but have not been very successful.

The ore at the Hannan's Brownhill mine having been dry crushed and passed through a 25 or 30-mesh sieve, is delivered to a separator, which divides it into about equal quantities of slimes and sands. It is only proposed in this paper to describe the separation and the treatment of the first product, the slimes. The crushed ore, as it leaves the screens, is elevated into the separator, and passes directly into a central conical hopper without the intervention of any automatic feeding appliance. The intermittent discharge from the buckets of the elevator does not materially interfere with the action of the separator, as owing to the length of the discharge chute of the elevator, combined with the construction of the hopper (which when the supply is properly proportioned to the size of the machine, is kept with a certain amount of material at its delivery end), a regular stream enters the machine, the baffle disc rotating with the center spindle further assisting in an even distribution of material. The vertical spindle of the separator is driven by means of the cone pulley and bevel gearing, and imparts a rotary motion to the disc and fan. The material falling upon the disc is thrown off by centrifugal action in a fine spray and subjected at the same time to the action of an air current induced by the fan. This current carries off the lighter particles with it into the outer casing, where they settle down into the conical chamber and are ultimately discharged.

The coarse particles or sands fall down over the grid against the action of the air current and collect in the inner chamber, and are withdrawn as required through the spouts. The separation required can be regulated either by altering the speed at which the machine is driven, or by the adjustment of the circular damper which regulates the amount of the annular opening through which the air current circulates. With some ores a bumping arrangement has been found necessary in order to shake down the material, which tends to collect on the conical sides of the separator, even though these be constructed at a steep angle. Compared with revolving or shaking screens, this separator offers the following advantages: (1) Absence of all screens which are liable to choke and require constant renewal; (2) easy adjustment and regulation of the size of the particles carried over; (3) the same air current continuously circulating within the machine, no dust escapes out of the apparatus.

From experiments conducted by the author upon oxidized ores from the Kalgoorlie fields at the works the makers of the separator, it was found that after reducing the ore by dry crushing so as to pass a 25 or 30-mesh screen, the fine dust particles of slimes could readily be separated. In some instances the sands assayed higher than the slimes, but no great importance can be attached to this consideration, as it evidently depends upon the state of the gold, and if this were very fine the slimes might be found to be the richest. The separator cannot be regarded as a concentrator, but simply as an apparatus for withdrawing the fine dust or slime-forming particles, whose surface is large in comparison to their weight. In many respects its action is similar to that of a hydraulic spitzkasten or pointed box. It may also be pointed out that all gold withdrawn from the slimes will necessarily be in a very fine state of division, and admirably suited for recovery by cyanide if the mechanical difficulty of filtration can be overcome.

The separation of the slimes from the crushed ore having been effected, either of the following methods, or a combination of them, could be used for the after treatment by the filter press: (1) Agitation of the slimes with cyanide solution and delivery of the sludge to the press, finally washing the charge in the press, or (2) if preliminary water or other washes be desirable, to agitate with the same, deliver the resulting sludge to the press and effect the extraction of the gold with the charge in the press by passing through it the cyanide solution, finally washing the charge as before.

In the general arrangement of the filter-press plant at Hannan's Brownhill, the slimes are introduced into vats and agitated by paddle with cyanide solution as long as may be found necessary to dissolve out the gold. The contents of the vat are then run into a receiver and forced by means of compressed air at a pressure of 60 or 80 pounds per square inch into the filter presses, the filtrate or affluent from the presses being delivered through a pipe into a vat, from which it flows in a constant stream through the zinc precipitation boxes to the sumps. The cakes having been washed in position so as to remove any cyanide solution they may contain, the press is opened and the cakes allowed to fall into a truck for tramming to dump.

The pneumatic forcing receiver or montejus consists of a cylindrical steel vessel with dished ends. The pipe leading from it to the press reaches almost to the bottom of the receiver, thus insuring, as soon as the air pressure is turned on, the whole of the contents of the montejus being discharged into the press. Prior to discharging the receiver, the charge is stirred up by admitting a certain quantity of compressed air through a small pipe to the bottom of the receiver.

The filter presses are of the distance frame, flat plate and four-eyed type, each press having twenty chambers forming cakes 28 inches square by 3 inches thick. From experiments made by the author at the works of the manufacturers of the pressing plant at the Hannan's Brownhill mine, it was found that with the slimes of some of the West Australian ores there is no difficulty in forming cakes of this thickness with ore that had been dry crushed. The cakes were examined by A. C. Claudet and found to carry 20% of moisture and to weigh about 130 pounds per cubic foot, from which figures it will be seen that one press treats per charge about 1½ tons of dry slimes. The operation of filling and washing a charge in the press is as follows: The sludge is forced into the press from the receiver through a passage by air pressure as described. This passage extends through the plates and communicates with the interior of the distance frame. The sludge continues to flow in until it completely fills the space between the plates, the liquid being forced out by pressure through the filter cloths on either side of the plates, and passes through the channels on the surfaces of the plates to the openings to the discharge pipe at the press head, and the opening would also serve for discharge of the effluent liquid during filling, but as it is connected up to the washing pump it is only used for the passage of wash water. After the cell has become compacted with material and no more liquid issues, the sludge inlet is shut and also the valve on the outside of the press. Water is then forced in and along the drainage channel on the surface of one of the plates through the filter cloth placed on this surface, and then through the cake, displacing the cyanide solution, and finally escaping through the filter cloth on the opposite side and out of the press through the opening. The tightening gear and other details call for no remarks, as the designs made may be widely varied without affecting the action of the press.

The chief advantages gained by the use of a press of the type described as compared with the usual type of press with recessed plates and central charging hole, mostly in use for sewage purposes, are that it permits of the cyanide solution contained in the cakes being effectively replaced by wash-water, and any desired thickness of cake secured by the width of the distance frame employed.

The question of the efficiency of washing and displacement of the cyanide solution contained in the cakes by the wash water is one of great importance when dealing with rich slimes, and this point alone would be sufficient to warrant the employment of filter presses in preference to the decantation methods. Experiments carried out on 3-inch cakes show that the washing is most complete, and that uneven percolation does not take place. One simple experiment made to investigate this point was to saturate the cake with a brine solution having a specific gravity of 1.100, and then to wash out this brine solution with water, and observe the rapidity of the fall in the specific gravity of the wash water as it issues from the press. The rapidity of this fall in specific gravity is a measure of the efficiency of the washing, for the drop is comparable to the displacement of the brine solution in the cake, because if channeling or uneven percolation through the cake had taken place there would have been a slow fall in the specific gravity of the wash water delivered by the press caused by the continual withdrawal of some of the brine solution. In many experiments it was found that a quantity of wash water equal to little more than the cubic contents of the cake was sufficient to bring down the brine soluble to 1.001. It is to be regretted that time did not permit of the experiments being followed by others in which the investigations were not only quantitative, but were accompanied by careful chemical analysis of the cakes and wash water. The author has, however, from more than one authority received confirmation of the efficiency of the washing in filter presses, a comparatively small quantity of liquid being generally found sufficient, except when dealing with precipitates of a very difficult nature, and from which it was required to wash away the last trace of the mother liquor, conditions which do not usually occur in the treatment of gold ore slimes. The author is not able at present to give particulars of the cost of the treatment of slimes in filter presses.

As regards the time occupied and the extraction obtained in the filter press, experiments made with 5 dwt. slimes when the mill was first started gave tailings assaying 1 dwt. after three hours' agitation, and the following average time for the completion of the cycle of filtering, washing, emptying and closing the press: Filling press from receiver, 15 minutes; washing cakes in press, 19 minutes; discharging and closing press, 16 minutes; total, 50 minutes.

The advantage of the filter press treatment is that the amount and strength of the cyanide solution can be regulated to suit the character of the ore under treatment. The amount of solution required for the usual cyanide filtration method, say one and one-half times the weight of the slimes, is sufficient to reduce the pulp to such consistency that it can be readily forced into the filter presses. In districts where water is not abundant the small amount of wash water required is also of great importance, for by the use of the press a minimum amount is required to displace the cyanide solution contained in the cakes.

By the successful and economic separation of slimes dry, without the aid of water, and the treatment of separated slimes, the advocates of dry crushing processes may certainly consider that their cause has received no mean impulse, for a process on these lines certainly enables the greater part of the float gold to be secured.

Generally, the author is of the opinion that the future will see filter presses more extensively used for the treatment of gold slimes, particularly in districts were water is scarce and where ores are of such a nature as to be difficult for ordinary filtration, on account of the excessive percentage of slimes produced when they are crushed. A filter press plant is not expensive for up keep, requires considerably less water, and will probably be found to give a greater extraction than any decantation method.

* Abstract of paper read before the Institution of Mining and Metallurgy in London.

Electrolytic Corrosion of Metals.

The extreme difficulty, if not impossibility, of preventing electrolytic corrosion in buried metal structures under certain conditions, is generally recognized, and although many of the best electrical experts in the country have now been grappling with the problem for a number of years no really satisfactory or practical solution has been offered. Nikola Tesla has suggested that were alternating instead of direct current employed for operating various street railways the difficulty now experienced through electrolysis would be done away with. This may all be, but it must be borne in mind in this connection that the application of the three-phase alternating current to street railway propulsion is of recent date and in actual use in but very few localities, and it is therefore scarcely to be expected that the street railway companies of a city such as New York would voluntarily change over to a more or less untried system, entailing as it would an immense outlay in money for new apparatus and machinery.—Electricity.

Mining Summary.

ALASKA.

(Special Correspondence).—Quartz mining is making a good showing here. A few good steady all-around miners can get steady employment here. Wages are $3.50 a day and board $7 per week.

Ketchikan, May 8th, '99.

Juneau *Miner*: Good reports come from some of the creeks in Porcupine district. The news from Porcupine, Calhoun and McKinley creeks is good. All are working, but Trail and Takeen are reported bad and men are leaving in disgust. There is too much snow on the ground for mining on most of the creeks. It may be the middle of June before mining operations are in full swing, and it will require this summer and next before the value of the Porcupine as a placer mining region will be known.

ARIZONA.

Prescott *Miner*: The Harlan mill on Turkey creek closed down on account of a scarcity of water. Mr. Harlan is putting in a pipe line 2400 feet to a spring, which, when completed and added to his present supply, will furnish enough to run continuously.——Mr. Taft has encountered a supply of water in his Sterling property on Big Bug. Between the water from the Sterling and that from the Lottie tunnel there is a large flow in Big Bug creek.——The Garcia G. M. Co., owner of the Garcia mine on the Hassayampa, near Wickenburg, which closed down for several months, resumed work and has a large force engaged in developing the property.——The Ardath M. & M. Co. have men at work erecting a mill and hoisting works on their Oriole mine at Santa Domingo mountain, near Wickenburg.——Mr. Cleveland, who has a lease and bond on the Cumberland mine, owned by T. Roach and others in Pine Flat, recently struck a body of ore 32 inches wide at a depth of 160 feet. This mine shows several shoots of ore. He has eight men at work developing it.——The company which purchased the Buster group in Pine Creek district has ten men at work building a road to the property. Mr. Hooper is in the East on business connected with the property, among other things to buy a mill. The mine is opened by two tunnels, in which there is a continuous ore body 900 feet in length. The company will run another tunnel, starting near the gulch, and connection with the upper workings will be made by upraises, and the ore will pass through it to the mill.——The Mohawk group, owned by ex-Supervisor T. Roach, adjoins the Buster group and is promising. A strike was made last week in a drift being run at a depth of 100 feet, where an ore body 4 feet wide was encountered. The ore averages $15 per ton.——Watts & Hanger also have a claim in the same district which they are developing.

Yuma *Sun*: G. Miles and F. O'Brien have gone to the Copper Mountain country, where they begin development work on a ledge of copper.——The Arizona C. & G. M. Co. of Phœnix, whose mines are in the eastern portion of Yuma county, near the Maricopa line, have made arrangements with Eastern capitalists for reduction works on their property.——Reports come from the Santa Maria district, in the extreme northeastern corner of Yuma county, that several copper strikes have been made.——C. E. Eichelberger has returned from a trip to the King district, where he has men at work on a prospect. The discovery of water in that vicinity has stimulated prospecting.——Water has been struck at a depth of 1000 feet within four miles of the King of Arizona mine. The company is erecting a mill and cyanide plant. The well will be sunk 100 feet deeper. There are several tons of ore on the dump and the force of miners is being increased.

CALIFORNIA.

Amador.

The Bunker Hill and Mayflower mines near Amador City have been sold at public auction. The sale was ordered by J. F. Aldrich, receiver of the Spring Garden National Bank of Philadelphia, Pa. The property is an asset of the bank, which was mortgaged for $200,000. The sale was ordered by the District Court of Philadelphia. The bidding was opened by C. R. Downs of Sutter Creek, Cal., who bid $21,000 for the property. The only other bidder was a Mr. Cheney of Philadelphia, who added $100 to the offers of Downs until the price reached $30,500, at which price Downs took the property. Downs is associated with W. F. Detert of Jackson; W. J. McGee, a local attorney, and State Senator Voorheis.

The Lincoln shaft at Sutter Creek is down 1000 feet.

The three-compartment vertical shaft at the Wildman-Mahoney is down below 500. Power drills will be put in as soon as the machinery arrives from the East.

The Kennedy M. Co. has appealed from the decision of Judge Nicol of Tuolumne county, in the case of the Argonaut M. Co. vs. Kennedy M. Co.

Supt. D. Fisher of the Hobart M. Co., operating the Spagnoli mine at Wieland, reports the shaft down 81 feet and sinking. It is the intention to erect a 10-stamp mill.

Butte.

Oroville *Register*: The Enterprise mines are busy, the owners taking out considerable gold.——The Gem gives employment to a number of men.——At the Golden Trout new machinery is being put in.——At the Slater mine good ore is being crushed. At the Crystal Peak a 200-foot upraise is being made.

Calaveras.

Several tons of quartz crystals and a large amount of agatized wood have been taken from the Green Mountain gravel mine, in Chile gulch. The crystals are of various sizes, some weighing over 100 pounds.

The Hobart Estate Co. and the Utica M. Co. are finishing their new electric plant near Murphys. The building has been built of lava from Table Mountain ranch. Its walls are 3 feet in thickness. The water power is expected to maintain a minimum of 2500 H. P., 1000 of which will be needed at the Utica mines and mills, which are again running.

The Angels mine has been cleaned up and placed in working order, the hoist and other machinery renovated under the direction of its owner, J. V. Coleman of San Francisco. As soon as a 20-stamp mill has been erected, work will be resumed on this property.

The new addition to the Gwin mill is provided with concrete foundations for the mortar blocks which are 14 feet in length. An air hoist has been put in on the 1400 level. The hoist is secured to a car and can be moved from place to place as required.

Mokelumne Hill *Chronicle*: It is reported that preparations are being made to resume operations at the Esperanza mine near Mokelumne Hill. The mill is to be increased to eighty stamps, a new hoist is to be erected and the shaft is to be sunk an additional 500 feet.

Angels *Echo*: The Bruner mine, two miles south of Angels, employs twenty-five men.——The Harris mine, one mile south of Angels, is to be operated on a more extensive scale than heretofore.——A 20-stamp mill is to be erected on the Angels mine.——Grading for the 120-stamp mill at Robinson's Ferry goes steadily on. This mill when completed will be the largest in the State.

El Dorado.

Placerville *Democrat*: One hundred men are employed at the Griffith.——A number of pockets are reported to have been taken out in the Kelsey district the past month.——Owners of the Ida Livingston, Kelsey district, have resumed operations, with J. Kelley Supt. A new shaft is down 50 feet.——T. Smith and P. Stingle have leased the Delmatia mine and are cleaning out tunnel and winze.——Roberts & McGraw have struck good prospects in their quartz mine in the Kelsey district, and are having a crushing made at the Ranney & Smith mill.——The Gopher-Boulder has installed new machinery, preparatory to resuming crushing.——The citizens of Georgetown have established a local mining district, with the boundaries as they were previous to the act of March 27, 1897.——J. S. Blackiston has bonded his Crystal mine at White Rock to A. S. Moore of San Francisco for sixty days. The mine is to be prospected for quartz crystals and gold.

Kern.

Six mills are in operation in the Randsburg district.

A run of ninety-five tons of ore from the Winnie mine, Randsburg, made at the Barstow mill, yielded $887, being the second run from that mine milled at Barstow. The first, of forty tons, made two weeks ago, gave $538.

The owners of the asbestos mine near Bakersfield are reported to have an offer from New York for the entire output.

The Wedge mine, Randsburg, has had a run of thirty tons of ore at the Red Dog mill which yielded $2500, averaging $80 per ton.

Mono.

Bridgeport *Chronicle-Union*: C. H. Glines and J. Hays, owners in the Arnot and Par Value mine on Green creek, are at the property getting the mine and surroundings ready for working this summer.

Nevada.

It is reported that a new shoot of ore has been struck at the Pittsburg mine on Gold Flat, near Nevada City. The mill will be put in repair and started up.

The North Star Mines Co. of New Jersey is a successor to the North Star M. Co. The North Star Mines Co. is capitalized for $5,000,000, or 500,000 shares, par value $10. J. D. Hague is president; W. L. Bull, vice-president; W. D. Pagan, Secretary. The directors include the foregoing, with A. G. Agnew and Benjamin Strong, all of New York. C. G. White of Boston will be added to the board. President J. D. Hague says: "The old North Star M. Co. has been operating for years in the Grass Valley mining district and acquired the North Star mine, which had up to that time produced $3,000,000 gold. The company reopened the mine, it having been idle, and it has since produced $2,500,000. The company has been acquiring additional property adjacent to the North Star, which in times past had been productive, in this way acquiring two or three large mines and a number of adjacent mining claims which have been consolidated and conveyed to the North Star Mines Co., the new company which will develop at great depth the combined property comprising the North Star mines, the New York Hill and the Massachusetts Hill or Stockbridge mine. These three mines have produced in the aggregate $12,000,000 to $15,000,000 and are now to be opened at greater depth. The Massachusetts Hill mine has produced within the last two years $800,000, nearly all of which came out of ground purchased for $30,000 to $40,000. The new company is in productive condition, taking out $30,000 to $40,000 per month, and has paid two dividends of $50,000 each since November."

Tidings-Telegraph: Moroney, Webb & Baldwin, who are interested in the Slide mine, at French Corral, have ordered a mill for their claim. The new mill will have a capacity of fifty tons a day. A Bartlett concentrator will be put in.

Placer.

T. Haney is working six men at Bloody ravine.

B. Kavanaugh is taking out pay from his mine near Bald mountain.

S. Savage has put up hoisting works at the Savage mine and is prospecting.

The shaft at the Whisky Hill copper mine is down 135 feet. Cuts have been run, opening up 1200 feet of the ledge. The rock yields 9% copper, $3 in silver and $5 gold per ton.

J. McAninch, G. Cowan, E. B. Quigley and J. Shiels have bonded the Glen Consolidated mine in Duncan canyon to a Colorado company.

Riverside.

In the Virginia Dale district a scarcity of water has obliged several of the mills to suspend operations. The water supply is derived from wells sunk in a dry lake basin north of the mines. The O. K. and Arbois are operated steadily, but several mines are shut down.

Los Angeles *Herald*: It is reported from San Diego that an effort will be made to work the lepidolite mines near Pala. An agreement has been filed in the recorder's office at San Diego whereby N. G. Douglas and other owners of the mines agreed to supply W. J. Schieffiin, a New York druggist, with as much lepidolite as he might want, up to 1200 tons a year, at $40 a ton. The agreement stipulates that none of the mineral shall be sold to anyone else for five years. This mineral is a lithia mica and contains handsome crystals of pink tourmaline (rubellite) in radiated groups.

San Bernardino.

Yuma *Sun*: G. Livingston and H. Randolph have gone to gold mines twenty miles from the river above Ehrenburg in California on which they will do development work. They have a ledge of free gold.

The Rose mine on the San Bernardino range, fifty-five miles easterly from Victor, is running, but there is a scarcity of water.

San Diego.

Lepidolite, with tourmaline, occurs near Mesa Grande in large granitic veins, not far from the Indian rancheria.

It is reported that a discovery of gold-bearing quartz has been made on the Warner ranch northwest of Julian.

Yuma *Sun*: There are eighteen men using dry washers and rockers in the Potholes district, twelve miles above Yuma, with good result. W. Boyle and partner, Mr. Riley, exhibited $22.10 in coarse gold which they took out of seven yards of dirt. The richest gravel is on the banks of the river under 2 feet of dirt which they strip, as it does not carry enough value to pay working in a rocker. It is impossible to reach bedrock, owing to the volume of water. This district has been producing gold for thirty years, but has never been systematically operated, the rocker and dry washer being the only methods used.

Shasta.

(Special Correspondence).—Near Igo J. P. Wright, who has been developing a silver property for a number of years, has found a 20-inch ledge, from which he made a shipment of several tons to the Selby Smelting Works. The returns were 500 ounces silver per ton.

H. Christensen is developing his claims near Igo, taking out a fair grade of smelting ore.

Price & Wartechek, on Muletown, are making their first shipment. They began work on their property two months ago. They haul their ore ten miles to the smelter.

There is a probability that the Afterthought copper mines will resume work. The property has been idle a number of years. They are twenty miles east of Redding.

F. Hurst has four men developing the Dobrowsky claims near Shasta. He made two twenty-ton shipments four miles by wagon to the smelter, and received $14.72 per ton on one and over $20 on the other lot.

The Mt. Shasta mine is pushing development work to 500 feet depth and employing eighty men. In consequence of development only five tons of ore per day are hauled to the smelter.

M. T. Howell & Co. are making a second twenty-ton haul to the smelter at Keswick.

Near Copley a group of thirty copper claims belonging to Ellis, Murray & Co. are being developed under bond.

Shasta, June 12th, '99.

Four hundred men employed by the Mountain Copper Co. at their mines at Iron mountain struck on the 13th inst., the result of a demand for increased wages. Last week the company raised the wages of 500 men at their smelters at Keswick 10% to 15%. Sunday a committee of miners at Iron Mountain demanded an increase. The quarrymen receive $1.60 a day, muckers $2.10 and miners $2.60. The committee asked an increase of 40 cents a day for each. The company was allowed until June 15th to announce its decision. On the morning of the 13th several of the men known to have led the demand for greater wages were discharged. The 400 at noon quit work and marched to the office and demanded their time. Enough ore is in the roasters to keep the smelters busy for a month.

Redding *Free Press*: It is reported that an agreement to purchase the Lowdon-Friday has been made by the Uncle Sam G. M. Co.—virtually a consolidation of the two properties in the Backbone district. The option is given until January 1, 1900. The consideration is withheld. The property of Lowden & Friday, known as the Cleveland Consolidated group, consisting of eight claims, adjoins the Uncle Sam. From the mines to a proposed smelter is a mile. From the smelter site to the railroad is three-quarters of a mile.

Redding *Searchlight*: H. C. Woodrow of Salt Lake, who has a bond on the Trinity group of gold mines at the head of Dog creek, six miles from Delta, reports that he will put three shifts to work on a mine of the group. He will sink a shaft 200 feet and drift under the ore body. There is now a 10-stamp mill and an electric plant on the property. A steam hoist will be put in.——C. D. Galvin and F. Grotefend are developing the King Copper property, three miles from Copley. Twenty-two men are employed in seven tunnels. It is thought the ore body will soon be reached.

Sierra.

The Plumbago mine, on the north side of the Middle Yuba river a few miles from Forest City, has been worked in a superficial way for years, and at times produced rich ore. C. Hegarty, Sr., of Moore's Flat, Nevada county, sold it to New York capitalists, and M. W. Mather was sent to take charge. Mr. Mather abandoned the shafts which had been sunk near the top of the ridge, and on the hillside ran three tunnels into the hill. Two of these are half a mile in length, and a fourth is contemplated which will have 1700 feet vertical depth from the top of the ridge. The tunnels were run on the ledge, which varies in size from a few inches to 5 feet in thickness. A 10-stamp mill is running night and day on ore. Bunches and pockets of rich ore are occasionally found.

Siskiyou.

Yreka *Journal*: The hoisting and pumping machinery for the new company to work the Nehrbass and Rostel grounds, adjoining the Blue Gravel mine at Greenhorn, will soon be working. Mr. Stevenson, who is to superintend the operations, has arrived in Yreka, and F. D. Fraser, who bonded the property, also returned.——Johnson & Kelly, who are mining old ground in the Greenhorn Blue Gravel mine on commission, are said to be getting pay from the present working. They do the timbering, hoisting gravel and sluicing at their own expense and pay 10%.——C. Fairchild has started his mill on Humbug, near Sucker creek, and finds good pay in the quartz. He has a 14-inch ledge and is close to the Thresh & Coulson ledge.——Mining is soon to be commenced in Yreka creek, in the vicinity of Hawkinsville, by the company which bonded the creek from Shasta river to the McNulty place near Yreka.——T. Austin & Co., working deep diggings north of the high school grounds, continue to find the average pay gravel.——Work at the Cherry Hill quartz mine on Cherry creek is carried on with success. It is the intention to run a 1500-foot tunnel towards the ledge 1000 feet below the surface, a survey having been made for that purpose.——J. C. Burgess is prospecting the ground at Cottonwood creek, near Henley and Hornbrook, for the company having a bond on same.

Yreka *News*: L. Erickson has out ore for crushing.——The Gold Ball and Aromas mines are working to their full capacity.——The Salmon River Co. is running with a large force.——Mr. Peterson of Eddys gulch cleaned up twenty-six ounces from a short run in his placer claim.——Peters Bros. have a ledge on White's gulch.——The Jumbo mine is reported to be bonded to Colorado parties.——The Gold Run is working twenty-two men.——The Knownothing has large bodies of ore and employs fifteen men.

Trinity.

The Morning Star mine, on Coffee creek, owned by Frue & Norton, is to put in power drills. There are two shafts—one 70 feet, the other 57 feet—and 310 feet of tunnel.

F. L. Dimock of Trinity Center has opened a copper ledge three miles above Trinity Center. There are two claims—Happy Day and June Day. A small cropping a few feet underground developed into a copper ledge 3 feet in width.

Redding *Searchlight*: T. J. Loftus recently discovered a ledge between porphyry and serpentine walls 100 yards west of the trail from the Nash mine store to the Keating mine. He has located a claim.——W. R. Conant is doing development work on his claim on Deacon creek.——H. Z. Osborn, formerly editor and proprietor of the Los Angeles *Express*, and M. H. MacIlvane, manager of the Nash mine store, have bought the one-half interest of J. Murphy in the Forest Queen mine and are running a tunnel which is expected to cut the ledge at 65 feet.——D. Donovan has located a claim on the Calahan trail near the Nash mine, one mile from the mouth of Hickory creek.——W. Maitland, Supt. Nash mine, has bought a copper prospect from C. J. Farmer. The claim is on Ram's Horn gulch, and, in addition to copper, shows gold and silver.——Ten men are employed at the Nash mine. The company is getting in such a shape as to work to advantage next year.

Tulare.

Porterville *Enterprise*: D. B. James, Supt. Minnie-Ellen mine, on Deer creek, reports finding ore in a vein 7 feet wide in one of the drifts. In the main vein they are in 30 feet of ore and still crosscutting. They have ore 90 feet wide in some veins. There are 3000 tons of ore on the dump.

Tuolumne.

The Tuolumne Mother Lode & Development Co. of Fresno has bonded the Columbus mine, which is a part of its property in this county, to San Francisco capitalists for $20,000. The Mother Lode Co. also owns the Big Oak group. This sale would give them $5000 for sinking on these mines, and the balance of $15,000 will go to stockholders as dividends.

Jamestown *Magnet*: Four claims on Whisky hill below Jamestown, known as Trio properties, have been incorporated under the laws of Wyoming, to be known as the Harvard G. M. Co., with a capital of 200,000 shares at $5 each. The claims included are the Trio, Mooney, McCann and Clark. The Erin-go-Bragh and Cloudman at Stent remain in the hands of the Trio trustees. It is reported a mill will be built.

Carters *New Era*: The Missing Link, adjoining the Buchanan, south of Carters, is being prospected by open cuts. A 6-foot vein has been found.——At the Buchanan a two-compartment shaft is being sunk which is down 650 feet. The company, it is reported, will put in an electric plant on the Tuolumne river. The mine has a 20-stamp mill and chlorination works.——The hoist, pump, buildings, etc., of the Junction mine, near Soulsbyville, have been transferred to the Laurel mines, near Arrastraville, owned by the Laurel G. M. Co. Eight men are employed at the mine.——The Chaparral, one of the pioneer claims of the east belt, is opened by two tunnels to a depth of 200 feet on a vein 2 to 7 feet

in width. The mine is being operated by Judge Lindsey of Columbia.

COLORADO.

The Argo smelter, at Denver, has complied with the eight-hour law and is running. The Guggenheim smelter at Pueblo is running. The closed works are under guard. At Central City men in the stamp mills are expected to strike. The mines already closed are the Commodore, Amethyst, Bachelor, Bachelor No. 2 and Last Chance, at Creede district; the Calliope and Hagerty, at Ouray; the Caribbeau and Montezuma, near Ophir; the Iron Mask and Black Iron, at Red Cliff; Smuggler, at Aspen. The Porter Fuel Co., at Durango, employing 150 men, has also closed. At Leadville 900 men have been discharged. Little except development work is going on. Four mines of the Colorado Fuel & Iron Co.—three near Canyon City and one in Pitkin county—have been closed down.

BOULDER COUNTY.

A strike of silver ore has been made in the Belcher mine on Caribou hill in the 200-foot level; almost solid silver ore was found. Three shifts are sinking the main shaft and when this lift is completed the shaft will be down 300 feet. Shipments are being made.

CLEAR CREEK COUNTY.

Georgetown *Courier*: By accident Mr. Anderson has located a new body of mineral in the 850 level of the Alluude mine.——A mill-run of ore from the Onie Bell returned four ounces gold and fifty ounces silver to the ton. ——Another tin discovery is reported in Clear Creek county.——A raise is under way on the Comet mine, Silver mountain, to connect with the old shaft. When the connection is made daily shipments are expected.——The Atlantic Milling Co. has entered into a contract with the Enterprise Tunnel Co. at Empire to do their concentrating. The output of the mine is now twenty tons per day, which will be increased.——H. Kneisel and others are developing a group of lodes on Democrat mountain. They have driven a tunnel 700 feet and within another 100 feet expect to reach a junction of lodes.

GILPIN COUNTY.

A recent strike in the Whiting mine, on the 320 level, is in ore assaying $200 per ton. Shipments from this property average thirty tons per day.

Eighty-three cars of ore were shipped from Blackhawk the first week in June.

The Maine is to resume operations under Mgr. Brereton. The present 250-foot shaft is to be sunk 100 feet deeper.

A new 25-stamp mill is to be built in Four-mile gulch, near the Rocky mountain concentrator, to be under the same management as the latter. It will be 33½x50¾ feet on the ground, of the slow-drop type.

Central City *Register-Call*: In May there were treated at the Rocky Mountain Concentrator in Black Hawk, 1250 tons of ore which produced 395 tons of concentrates. Mgr. J. Hannigan says A. L. Collins intends to put up a 25-stamp mill on the site of the offices at the rear of the concentrator. The mill will have twenty-five slow drop stamps weighing 700 pounds each and dropping thirty-five times to the minute.

GUNNISON COUNTY.

(Special Correspondence).—R. W. Spensley, formerly of Leadville, has gone to resume work on the Union Park placer property, which is near the Watson or Taylor Park placer. He is putting in a bedrock flume, which will have a length of 4000 feet and is 3¼x3½ feet. The company have already in 1600 feet of flume besides the one now building. Thirty men will be employed this season.

The Mgr. of the Watson placer is also on the ground and will start work. They will soon begin using the giants. It gives employment to fifty men.

Work has been resumed on the Maple Leaf property, on Cochetopa creek. The shaft will be sunk 100 feet farther and drifts and crosscuts will be run. The shaft is now 50 feet deep. Some rich ore has been shipped from it in the past.

At the Tuller & Riley property considerable development work had been done during the latter part of the winter, which has produced seventy-five tons of ore that will pay to ship. The vein is 8 to 20 inches wide and is in a dyke which cuts the schist formation nearly at right angles. The vein has been exposed by open cuts and shafts for 2000 feet, and in all these places free gold can be seen in the quartz. There is also tellurium in the rock. An offer of $40,000 has been made for this property by outsiders, but the owners demand a higher price; a deal is expected at a compromise price. The property is well situated for milling purposes, as it is thirty rods from Beaver creek, where power can be generated for all purposes.

It is rumored that the ore from the Diamond K did not run as well as expected, and work may not be resumed.

It is understood the Daniel Dorondo is under option to Denver people.

Ross & Breden report a rich strike on the Iron Cap hill. The rock is jasperized quartz and gold can be seen with the naked eye.

Work is steadily progressing at the Venable but all information is being suppressed at present for some cause.

The Underhill M. Co. have put a force of men on their three claims, west of the village of Spencer.

J. Dunbar is doing assessment work on a group of eight claims near the Iron Cap property.

The deal has fallen through on the Iron Cap mine.

The Vulcan mine has again started and they are filling the mine with miners as fast as they can secure good men. None of the strikers are being put on the force. The mine will again take rank among the foremost in the county.

The first car of ore from the Midland under its present management has been sent to the smelters. If it proves satisfactory many more will follow.

Mr. Johnson, the principal owner of the Branch mine, has put on a whim and is sinking. The shaft is 60 feet deep. This property is a copper prospect. The vein is 3 feet wide at 50 feet and will run 25% copper and some gold. The ore is principally red oxide. There are a number of other prospects near the Vulcan that show good values in copper.

It is reported the Standard and Sterling properties, on Cochetopa creek, are to be started. These mines produce milling ore which may be suitable to cyanide treatment. The vein is 3 to 7 feet wide and runs $10 per ton.

J. P. Smith has secured an option on the Keystone group through G. W. Bartholemew. He expects to open the property and ship ore. The property has large bodies of galena ore, which also carries silver, copper and gold. The vein is 15 feet wide; 2 feet of it will pay to ship without sorting, and the balance is a good concentrating ore. The property is developed by two tunnels, each 700 feet long. A number of other veins are found within the limits of the claims, but have had little development. The property is favorably located, both as to railroad and water power, being half a mile to each. The price to be paid is somewhat less than $50,000.

J. A. Goodwin is in Boston trying to float a property from this county with a good prospect for success.

Gunnison, June 10th, '99.

HINSDALE COUNTY.

The Lellie, seven miles from Lake City, which has averaged a shipment of 3¼ cars of ore per week for eighteen months, is to be equipped with new machinery, comprising hoist and compressor.

LAKE COUNTY.

(Special Correspondence).—It is estimated the section which holds the down-town mines at Leadville makes 2000 gallons of water per minute. To keep it unwatered five pumping plants are employed constantly, having a combined capacity much in excess of the present demand upon them.

The Weldon, one of the down-town groups, is operating its two principal shafts and will soon be producing, as formerly, 150 tons of lead-carbonate ore per day. Mgr. T. S. Schlessinger states that the force of thirty men will be increased.

The Neubian M. Co., also under the management of Mr. Schlessinger, is preparing to sink a shaft on a forty-acre tract which they control in the down-town district.

Leadville, June 7th, '99. WASCOTT.

The Comstock Mining and Leasing Co. has secured five well located claims near the Antioch, with a territory of fifty acres. These claims include the Amelia, Prince Albert, Comstock Nos. 1 and 2 and Thunderbolt. The new company will put down a shaft 800 feet. The officers of the company are A. W. Lawrence of Boston, Pres.; G. Flint of Boston, Sec'y and Treas.; R. B. Estey of Leadville, Gen. Mgr. One of the new shafts sinking on the Alhambra placer of the Revenue Co. will be sent down 600 feet. A second shaft has been started on another part of the ground and a third shaft will be started. The Revenue people have 140 acres of ground in their combination, which lies between California and Iowa gulches, and is about a mile east of south of the city. The officers of the Revenue Co. are R. C. Surbridge of Boston, Pres.; G. M. Steer of Boston, Sec'y and Treas.; R. B. Estey of Leadville, Mgr.

The President mine on Breece hill has commenced shipping fifteen tons of gold ore daily, adding another to the list of producers of the gold belt.

The Louisville mine, owned by D. H. Moffat, is now a producer of zinc ores as well as oxide and sulphide ores carrying gold, silver and lead. Zinc is being broken for the zinc mill in California gulch.

MINERAL COUNTY.

(Special Correspondence).—The owners of the Amethyst resumed management of that property on June 1st, at the expiration of Carver & Miller's lease.

The Commodore maintains its shipment of 400 tons per day.

The Happy Thought mine has been pumped out down to the seventh level, giving access to ore blocked out on that level. Part of this ore is concentrated at the Happy Thought mill and the balance shipped to the smelters.

Creede, June 12th, '99.

MONTROSE COUNTY.

The La Sal mountains, near the boundary line of Colorado and Utah, promise to be the scene of active prospecting and development during the coming season.

The sandstone surrounding the La Sal range extends entirely around the mountains, and everywhere is more or less impregnated with copper. The circle commences at La Sal creek, on the Colorado side of the range, where the Paradox mine is located. The ore is found again in the Big Indian mine, on the south slope, then in the Salt Wash district, on the west end, then in the Welsh and Huntsman, on the north, and from there the line is traced back to the Paradox, the distance being about 200 miles.

The Salt Wash district has been examined by T. L. Darby, who says that it is not likely to prove valuable, but other mines have opened into bodies of ore and are being developed. The Huntsman group of three full claims has been sold for $80,000 and the owners are putting the property in shape. The company will ship forty tons of ore to Salt Lake City.

R. Dillon has located a tunnel. The tunnel will reach a vertical depth of 1500 feet from the apex of the mountain.

A number of low-grade gold prospects have been found in the vicinity of Miners' basin and a company has been organized to build reduction works. Chicago people have bought the Mazeppa mines in Beaver basin and are considering the building of cyanide works.

OURAY COUNTY.

Sunday the Wedge M. Co., at Ouray, posted a notice informing the employes that the miners would go down the shaft on the company's time and come up on their own time, and take one hour for dinner. This action was not in accordance with the eight-hour law, according to the miners' views. The mine was closed down and the men paid off.

One hundred cars of ore were shipped from Ouray in May.

The force of men on the Revenue mine is larger than it was last year.

The Atlas, on Bear creek, is proving a success and working with increased force.

PARK COUNTY.

It is reported at Colorado Springs that the Green Mountain M. Co. has sold its thirty-two claims and 2500 acres of placers, patented, to the Calumet & Hecla M. Co. The property is located in Alma district and is undeveloped The Lee shaft is in a 5-foot vein of copper and iron pyrites. The mines are equipped with machinery, and two mills are in operation.

SAN JUAN COUNTY.

(Special Correspondence).—On the 9th inst. B. W. Sweet of Denver secured a contract to erect a 50-ton concentration mill at Gladstone, near Silverton, for the Red Mountain & Bonita G. M. Co., of which Dr. C. A. W. Zimmerman is Gen. Mgr. and whose home office is at Quincy, Ill. The mill will comprise stamps, rolls and concentrators. The Gates Iron Works are to furnish the machinery.

Denver, June 9th, '99. WASCOTT.

The Silver Queen is being developed by its owners, most of whom are residents of Kearney, Neb. It is to be further equipped with machinery. The development is mostly tunnel work at different levels on the vein. The ore is smelting and of a grade to stand shipment. It is claimed ores of the value of $30,000 have been shipped.

SAN MIGUEL COUNTY.

Denver *Republican*: Shipments for May from the Ophir district show an increase. The last week was the heaviest of the month, the total being thirteen cars—four cars of concentrates from the Caribbeau, four cars of ore from the San Bernardo, one from the American Frenchman, one from the Montezuma, two from the Butterfly and one from the Alta.

SUMMIT COUNTY.

The Hamilton mine and mill, in Summit gulch, are expected to start up in a few days. Concentrates, accumulated during latter part of winter, are being shipped.

TELLER COUNTY.

(Special Correspondence).—The Work properties on Raven and Gold hills are worked by sixteen sets of lessees. The gross receipts from sale of ore for the year ending June 1, was $46,102.

The output of the Orpha May on Bull hill was 750 tons of ore for the month of May, averaging four ounces gold to the ton.

A recent shipment of ten tons of high-grade ore from the Last Dollar on Bull hill brought $1900 to the ton. This came from a newly opened body of ore containing a streak of quartz carrying fine gold and is below the sixth level.

The Isabella Co. has declared a dividend of 2 cents per share, amounting to $45,000, payable June 26th.

The National M. & L. Co. are preparing to develop a group of properties on the north slope of Tenderfoot hill. It is claimed this company paid $5000 for the group of twenty-one acres.

The Matoa G. M. Co., whose Matoa mine is on Gold hill, have purchased an adjoining property known as the Johnson lease, claimed to have produced $500,000. The purchasers will sink 200 feet to the 800 level.

Cripple Creek, June 11th, '99.

Denver *Republican*: A large quantity of mineral is being broken by two sets of lessees operating on the Pinnacle Co.'s ground, who recently made good strikes.——On the Lansing the lessees are getting the lease in better shape as regards equipment. In the breast of the drift run at the second level the ore body measured 5 feet.——The strike made on the Mitchell of the same company is holding out. The lessees are preparing a carload shipment to be sent out this week. There are ten tons in the bins. The find is supposed to be a new vein, the strike being toward the Lansing workings.

IDAHO.

J. Lefler, a prospector, reports a discovery in the Crooked river country, midway between Buffalo Hump and Salmon river.

Warner Bros. have 8 feet of lead, of which 5 feet is solid quartz and 3 feet granulated quartz which assays $45 and this has been stripped for 900 feet. The claim is named the Drum Lummon.

Smith & Blake have also made locations, their principal one being the Monday, parallel to the Drum Lummon on the west.

While water has been plentiful the Granite M. Co., has been ground sluicing its ledge east of the old works and uncovered it where it was 18 feet wide. In the old workings the ore is a high-grade gold ore, but base, the amount of free gold saved on the plates being small and concentrates run high enough to ship to the smelter. Where the vein was recently uncovered it is galena, the surface assaying 30% lead, $13.27 gold and two and one-half ounces silver, making ore worth $40 per ton.

The second payment of $25,000 on the bond of the Big Buffalo mine at Buffalo Hump is reported paid. Since the first payment a shaft has been sunk 60 feet. The Big Buffalo was purchased on a bond by Clark & Sweeney of Spokane, and it is understood to have been floated in New York.

There is excitement in the Boise basin country over the discovery of a rich gold ledge three miles west of Idaho City.

Placer gold is reported discovered on the St. Joe, near the mouth of Slate creek. The gold was found on a side gulch high above the creek, but at last reports bedrock had not been reached.

The Helena and Frisco mines at Wallace have started up with twenty to twenty-five men each, under military protection.

Spokesman-Review: The Monte Cristo mine at Buffalo is working seven men, running three shifts of eight hours each. They are down 30 feet in the shaft, in ore, with neither wall in sight. The quartz from the shaft shows free gold.——The Saint Paul, adjoining the Monte Cristo, has had crosscutting on the surface and shows the same character of ore as the Monte Cristo. For 4500 feet the ledge shows a width of 6 to 10 feet on the surface. ——On the Big Buffalo workmen are crosscutting. It is said that the crosscut is in over 40 feet and the other wall not reached. ——F. Brown, constructor of the trail into camp, says the workmen are within thirteen miles of camp, and he thinks ten days more will see the work completed.

Boise *Statesman*: The DeLamar M. Co. is reported to have purchased the Big Buffalo mine for $500,000 on June 7, the first payment of $25,000 to be made July 15. This mine is the original discovery of the Buffalo Hump camp.

Salt Lake *Tribune*: At Salmon City, F. Ibach arrastraed ten tons of ore from the Kittie Burton on Indian creek, which turned out a bar weighing thirty ounces in gold, with ten ounces remaining in the crevices of the arrastra, which continues to run on the same class of ores. There are 18 inches on the foot wall that will average $75 per ton.——The representatives of New York parties who recently bought the Ulyssus group of Suydam & Ibach are letting contracts for a 5-stamp mill, etc., the machinery for which is at Red Rock station.

NEVADA.

Repairs to the hoisting engine at the C. & C. shaft in Virginia City have all been completed and work resumed in the Consolidated California & Virginia mine through the shaft. The first elevator will be raised, the defect located and remedied and the elevator again put at work. Meantime the second elevator keeps the water down, running eight hours out of twenty-four.

The New Pass M. Co. has shipped its first gold bullion from ore running $16 per ton.

The Dexter M. Co. of Tuscarora has sent over $5000 in bullion to Salt Lake.

De Lamar *Lode*: Searchlight lies between Manvel, San Bernardino county, Cal., and the Colorado river, being ten miles west of the latter and twenty-five miles northeast of Manvel, the terminus of the California Eastern railway. There is a good wagon road to the camp. There are 150 persons in Searchlight district, and twenty of the properties are working. Among those developing mines are F. W. Dunn, E. J. Coleman, F. C. Perew, B. Macready of Los Angeles, and Daugherty, Rose & Colton.——The New Years Gift and Searchlight are owned by the Searchlight M. Co. On the New Years Gift two shafts have been sunk 100 feet apart and connected at the bottom by drift. There is also a drift 30 feet east of the shaft and an upraise 50 feet. The shafts were sunk on the vein, and in sinking considerable ore was taken out and one carload shipped. On the Searchlight two shafts have been sunk, one 100 feet and the other 120 feet. They are parallel claims; the shafts were sunk 120 feet apart and on the vein. A drift will connect the shafts. The drifts were run in the wall and the ore left in place. All the ore extracted in sinking is on the dump with the exception of a few carloads shipped for test. The width of the vein is 4 feet and will average $23 in gold per ton. There are twelve men employed. Sinking will be continued as soon as air connections are made.——The Good Hope claim is owned by F. Colton. It has a shaft 100 feet deep on the vein, and in sinking several carloads taken out were shipped which averaged $125 in gold.——F. Perew has a number of claims upon which 300 feet have been sunk.——E. J. Coleman is down 50 feet on three of his claims and has a good showing.——B. Macready is opening the Golden Treasure and Copper King.——On the Copper King a shaft is down 100 feet and a 50-foot shaft on the Golden Treasure. These claims are parallel. They are drifting on the vein to connect the two shafts. The vein is 18 feet wide. In running a crosscut 50 feet two veins were encountered, one 4 feet and one 18 inches wide, each averaging $30 in gold per ton. A whim has been put up and ten men are employed. So far ore is piled on the dump until the best method of treatment is determined.——On the Goodenough and Rajah claims, owned by Boller and Lovey, two shafts have been sunk to a depth of 70 feet and both show ore.—— The Hopkins group of six claims is in charge of F. W. Dunn. The owners of this group are also part owners of the Copper King and New Years Gift. On the Pope there is a perpendicular shaft 100 feet deep which cuts four veins, the smallest of which is 14 inches, the largest 4 feet; from the bottom of this shaft a crosscut has been run to tap seven parallel veins which crop on the surface. On the Columbia a 50-foot shaft has been sunk and 30-foot drifts run on the vein. This vein, as well as other veins, runs northeast and southwest. The Columbia veins dip to the southeast, the Pope and Boston to the northwest. On the Columbia a double-compartment shaft is down 75 feet, timbered. Sinking will be continued. On the Boston a shaft on the vein has been sunk 220 feet, and at the 100-foot station drifts both ways have been run 300 feet, and at the 150-foot station drifts each way 125 feet. At 205 feet water was encountered and at this point a drift has been started to make connection with the double-compartment shaft, a distance of 150 feet. The crosscut is now in 80 feet and in this distance three veins have been passed through.

NEW MEXICO.

Santa Fe *New Mexican*: W. R. Doran and W. W. Fitzpatrick have opened a 4-foot vein

of fine looking copper ore in Lincoln county. ——Work at the Malaga coal mines has been suspended and the force removed to the Salado mines.——The claim holders of the Jicarilla mining district will put a stop to the illegal cutting of timber.——The Colorado Fuel & Iron Co. employs forty mules and sixty horses hauling ore from Hanover to Santa Rita.——H. C. Meyers made a gold discovery at Gold hill, near Lordsburg. Assays of the paystreak run six to fifteen ounces in gold. ——After two years of work the Catherine management has struck the rich Snake vein in Sierra county.——W. H. H. Llewellyn has given orders to resume work on the tunnel in Animas peak.——All the men on the Timber Peak mine and mill, with the exception of three, were laid off and work will not be resumed until the return of Mgr. R. H. Sanders from Philadelphia, where he is attending a meeting of the stockholders.——A gasoline engine and hoist have been put up at the Excelsior mine, Organ.——The Mormon mine near Organ has been bonded to Enock & Jewel of Kansas City.——J. C. Greenway of Pittsburg, Pa., has taken a bond and lease on a group of copper claims in the San Andreas mountains. He will put a force of men at work under T. Jones.——A 10-inch lead of galena has been struck on the left fork of Red river.——A. R. Manby of Taos has located a number of gold and copper claims in the Rio Arriba copper country.——The Abbott Bros., working the iron placers on Placer creek, are taking out gold in paying quantities.——Development work has commenced on the Grand View on the Columbine. The property carries lead and gold.——The Whale mine, recently sold to Montana parties, is shipping gold and copper ore and prospectors are making new locations and starting development. ——The Mystic, on the west side of Baldy, in Colfax county, has been bonded to Indiana parties for $40,000.— Prospectors near Sweet Water have discovered a lead of quartz cropping near an inclined bed of copper-bearing shale.——J. G. Schuman of Santa Fe has bought one-half of the interest in the Texas Girl, near Bland, from T. B. Ward. He has also bought the Padre lode from M. Hill.—— Much of the ore taken from the Montoya mine, Santa Rita, runs 75% copper.——Burns & Spafford have leased the Romero Extension mine at Santa Rita, Grant county, and have sunk a 100-foot shaft. They employ fifteen men.——Bible, Halleck, Jay & Co. have sunk a new shaft which taps the old Spanish workings on the Carrasco mine at Santa Rita. They found a nugget of copper weighing 1500 pounds.——Bragaw & Potter are working the Modoc-McCarth group at Hanover, recently sold by A. W. Tenant of Santa Fe. On the Modoc a drift was started in the ore body. The returns at the smelter give 7% to 12% copper.

OREGON.

(Special Correspondence).—A number of mining men have been making an examination of the property of J. H. Searles, near Cornucopia. The property has a 20-stamp mill and comprises a group of fifty claims. The ore is concentrated and shipped to Tacoma. Concentrates are reported to run $225 per ton. The veins are from 2 to 10 feet wide.

The placer mines of J. Arthur are again being worked. The force will be increased as soon as the snow in a 30-inch sluice permits.

Cornucopia, June 4th, '99.

Sumpter *News*: Dr. J. J. Fisher and D. Copping of Sumpter have sold their Pine creek placer ground to H. E. Courtney and J. I. Sturgil of Baker City.——The Sloan & Haskell placers at Susanville are showing up well. As high as $85 to the pan has been taken out from bedrock, we are informed by Mr. Sloan.——J. M. Jones has sold his half interest in the Golden Treasure, the west extension of the Amazon, to S. Chapman of the Ibex for $4000. There are four parallel veins in the property, with a considerable development and necessary buildings. Assays will average $15, running as high as $40.——J. D. Young and P. G. Estes of Sumpter have sold their Gold Hill mine, an extension of the Mammoth, to J. A. Panting, Mgr. Burnt River M. Co. The consideration is $15,000, of which $5000 was paid down.——The Annalulu mine, situated on the same vein as the Mammoth and Amazon near Sumpter, was bonded by the owners—L. J. Hazlewood and Dr. G. W. Tape—to S. Chapman of the Ibex. The bond is for $15,000, payable in two years, with a cash payment of $1500. Dr. Tape purchased a one-fourth interest in the Annalulu last winter for $200.

Grant's Pass *Mining Journal*: The Channel hydraulic placer property and adjoining claims, comprising the Old Channel 60 acres, Booth 160 acres, Oregon 160 acres, Rialto 160 acres, Powelson 20 acres, Golden Link 60 acres and Rich gulch 40 acres, situated on Six Mile creek (a tributary of the Illinois river), thirty-two miles from Grant's Pass, has been sold to C. B. Beardsley, W. H. Thompson and others of Chicago. The owners were J. O. Booth, F. D. Burns and associates. It is an auriferous gravel deposit, occupying a high plateau 400 feet above the river, on which there is a frontage of more than two miles. The mine has been worked for years in a small way. The property will be equipped with modern hydraulic mining machinery, and Surveyors Wright and Perkins have made surveys for a ditch that will be 3½ miles long and give them a pressure of 300 to 350 feet with about 2000 inches of water.

SOUTH DAKOTA.

On the Dakota Maid M. Co.'s property of fifty-four acres large bodies of ore are opened up. The Dakota Maid has a 1000-foot tunnel and a 160-foot shaft with stopes at the bottom, besides numerous tunnels, pits and shallow workings on different parts of the location. When the west drift is extended 20 feet on the level of the 1000-foot tunnel it will tap the fissure at a vertical depth of 376 feet.

The Holy Smoke camp is two miles from Keystone. The Holy Smoke was located by J. A. Clark. The Golden Return M. Co., composed of H. F. Chipman, J. H. Duffie, H. Binswanger and E. G. Stevenson of Detroit and J. A. Clark, own the Holy Smoke and Vulcan, which originally included ten claims, to which have been added, by purchase, four adjoining claims. There are on the property five ledges, two of which have been opened. A shaft has been sunk on the Holy Smoke 150 feet and an ore body 40 feet wide encountered, assays from which return $3.10 to $24.80. It is free milling and concentrating ore. In the Vulcan shaft, 100 feet, ore was found a few feet from the surface and the shaft has continued in ore all the way down. The ore is copper and gold similar to the Holy Smoke and assays from $1.60 to $9 in free gold and $14 to $90 in concentrates. It is the intention of the company to equip the Vulcan shaft with a steam hoist, pumping plant and air compressors.

Deadwood *Independent*: Wolzmuth & Co., owners of the cyanide plant at Spearfish, and who have a lease on the Alameda property, near Portland, are shipping regularly to their plant in Spearfish.

UTAH.

The Jersey Blue group of mines at Bingham has been sold to Eastern people, it is reported, for $250,000. The purchasers include C. E. Graham and J. Kennedy of New Haven, Conn.; C. Burr of Middleton, Conn.; J. B. Collins of Chicago and I. S. Pine of Colorado. The vendors include Dr. J. K. W. Bracken, J. C. Dugan, C. H. Lashbrook, E. Rauch, J. Poudler and W. C. Hazelgrove of Bingham; F. L. Force of Charlotte, Mich., F. Pence of San Francisco; and O. Will of Salt Lake. The Jersey Blue group consists of the Jersey Blue claim, the I. X. L., Little Cottonwood, Big Giant, Elmore, Manila, Albatros, Harrison, Howard and Chandler, containing nearly 200 acres.

Salt Lake *Tribune*: At Castle Dale, from the work done, it is evident that the main body of mineral is confined to a blanket deposit, varying in width from a few inches to many feet, and extending from Green river to Hanksville on the east and from Castle Dale to the Fremont river on the west. In the center of this area is what is known as the San Rafael swell or reef. This reef is the result of volcanic disturbance, the formation being sandstone and lime. Porphyry has been injected into the overlying strata. The erosion of the crown of the uplift has left a jagged fringe of rock encircling the center of the disturbance. It is between the main body of the reef and what has been the overlying formation that the principal deposit of mineral-bearing rock is found, chiefly copper, carrying small quantities of gold and silver. The copper occurs in a layer of lime varying in thickness from a few feet to 24 feet, and encircling the reef a distance of 200 miles. The blanket, where it is exposed, dips from the reef at an angle of 45°, diminishing until it reaches its normal position of horizontal, where it attains an estimated depth of 3500 feet below the furface. Besides this blanket there are in the main reef fissures of more or less extent and width carrying values in copper and silver of a better grade than are found in the blanket.

WASHINGTON.

The Dear Trail No. 2 M. Co. paid a monthly dividend of $2500 June 15, making a total of $32,500 paid by the company from ore shipped in course of development, never exceeding four cars per month, and rarely more than two. The mine is in Cedar Canyon camp and produces high-grade silver ore.

J. Howard has located a group of copper bearing veins in the south half of the Colville reservation on Capital hill; he has a vein 10 feet wide carrying copper ore.

Galena and copper ore have been found in the Mable at Republic. The finding of galena ore is something new in Republic camp.

The mines of Republic camp are reported to have done development work during May which aggregates one mile of shaft and tunnel.

Spokesman-Review: The Morning Glory at Republic is to be developed to greater depth. A winze will be sunk from the tunnel on the ore shoot which was first opened in the shaft and later in the tunnel.——The North Star G. M. Co. has closed a deal for the purchase of a fractional claim which lies east of the North Star claim in Republic camp, which gives a tunnel site on the level of Granite creek, from which a tunnel can be run in 300 feet to tap the vein.

WYOMING.

T. F. Carroll of Fremont, Neb., is doing development work on the Shipper mine on Miner creek, four miles south of Grand Encampment.

FOREIGN.

AUSTRALIA.

Melbourne *Standard*: The Yankee Creek district, ten miles east of Bendigo, has for some time been prospected by private parties, and some promising shows have been opened. Slingo and party have had profitable results, a crushing going as high as four ounces to the load. The pioneer prospector, Mr. Greaves, sank a shaft 200 feet to water level and crushed stone which went 9½ dwt. per load. Twelve months ago another shaft was sunk, 270 yards south of the original workings and a reef was cut 6 feet from the surface. The stone was 16 inches thick and was followed down on the eastern underlie 75 feet, varying in thickness from a few inches to 5 feet, averaging 3 feet. From this reef twenty-one loads have been crushed for seventy-five ounces, 19 dwt. Slingo and party have been successful. They are driving on 3 feet of stone, in which fine gold can be seen at a depth of 70 feet. A small battery in the district is needed as the stone crushed has to be carted to Bendigo or Ellesmere. —— The Inverell Diamond Field, Ltd., have plenty of water for all purposes. One hundred men are employed in the mine. The washing turns out rich both in diamonds and tin.——Elliott's Soldier's Hill property is running. His diamond and tin saving machine is working satisfactorily.——The Old Malacca, idle for some time, is starting again.——Kenzie & McCartney have bottomed their new shaft on wash, and the prospects of diamonds, gold, and tin are better than any they have had previously.——On the Borah Creek silver field, J. Howell has put in two tunnels and sunk two shafts on a rich silver mine. The ore is is a clean galena, going 70% lead, and at the present price of silver each ton of ore is said to be worth £22. This lode is 2 feet to 5 feet thick.

BRITISH COLUMBIA.

The Canadian Pacific extension from Rossland to Penticton, via Greenwood camp, is being pushed rapidly.

The parties interested in the Old Ironsides and Knob Hill groups at Greenwood have commenced the construction of their smelting plant. On these properties are large ledges of low-grade copper sulphides and iron, carrying gold values. The vein matter contains considerable lime. This camp is seven miles north of the Washington line.

Since the snow has about disappeared in Burnt Basin district there has been a renewal of activity in that section. The ores at first found were of the free milling sort, but more recent exploration has developed large deposits of sulphide ores. The Mother Lode is being developed. One vein of free milling ore on this property has been stripped for 200 feet and another of high-grade ore, 5 feet in width, has been uncovered. Another, showing 13% copper, has been stripped 1000 feet. The management will tap these ledges by running a 300-foot tunnel.

The Pleasure of Hope, owned by the St. George M. & D. Co., T. G. Elgie of Rossland Mgr., is being worked and the shaft is said to be in solid ore.

J. Hamill of Armstrong, B. C., and D. Graham visited the Basin to have some claims surveyed. They, with others, own the Barrow, Copper Farm and other properties. One of them was recently bonded for $20,000.

The Jackstraw, 1500 feet from the Mother Lode, owned by Hunter & Sharp of Rossland, has been worked and a ledge of free milling quartz uncovered. Free gold is visible to the naked eye in samples.

Willarson & Johnson have given a thirty-day option on the Big Chief group to a Montreal syndicate. These adjoin the Mystery group and have the same general formation.

Cowan & Hickman have commenced work on the Lucky Four, a group of claims situated on Boulder creek, seven miles from Trout lake.

J. W. Westfall, Supt. for the Old Gold & Primrose M. Co., will commence work on two of the company's properties with an increased force.

Morrison, McCord & Johnson have given an option for thirty days on the John L. group to J. Dixon of Vancouver. The value placed on the property is $20,000.

The Silver Belt group on Brown's creek, west of the south fork of Lardo river, on the Silver Cup ledge, will be worked this summer. The owners, H. H. Johnson and M. H. Dobie of Rossland and G. K. Morton, St. Thomas, Ont., will be associated with Eastern capitalists.

A strike has been made on the Merchant Townsend group, also known as the Downs group, above the Sunset property on Trout creek, near Index.

On the Capella group, Goat mountain, near New Denver, work is still in progress and high-grade ore is being taken out. A shipment of ninety sacks is being packed to the wharf.

Work is being pushed on the Hartney, Merrimac, Marion, Convention and Home Run, on Silver mountain, on all of which ore is showing.

Kaslo *Kootenaian*: A find was made last week by H. Mathews three miles from Duncan City on Howser lake. The formation is lime, believed to be a continuation of the lime formation on which the Bannockburn, Wagner, Gertrude and other claims are located. This is the first important discovery on the peninsula. Mathews states that the ore is $30 galena.

SOUTH AFRICA.

South African *Mining Journal*: The Schuller diamond mines are developing their No. 2 mine, ninety claims in extent. There are 20,000 loads of yellow ground on the floors, which will be ready for washing at the beginning of the month. There are 600 loads of blue on the floors weathering. The manager is sinking an incline to prove the northern boundary of the pipe. The opinion is held that these pipes, which occur in the Magaliesberg sandstone, will go down straight, and not like the pipes of other parts which crop out through shale and are funnel-shaped, tapering off to forty claims at 1000 feet depth. ——At the Wilgespruit, 660 feet to the north of the new reef, are found the Hospital Hill shales, much contorted, but unmistakable; the intervening space is occupied by beds of quartzite, with small bands of shale. On the footwall of the reef there is a thick bed of quartzite, and a thin band of shale separates this from the reef proper. This shale contains only a small quantity of gold. The reef itself is 3 feet in thickness and consists of altered quartzite. There are evidences of stratification, and the opinion is that the reef is one of the sedimentary beds of the Witwatersrand series. On the hanging wall of the reef there are 6 feet of quartzite and then shale; some distance south is another quartzite leader which pans gold on the outcrop. South of this are quartzites and shales, the latter predominating. Assays show at 22 feet, 3 feet of reef, 24 ozs. 17 dwts.; at 30 feet, 33 ozs. 6 dwts.; at 35 feet, 28 ozs. 4 dwts. The crosscut is in some distance, and has not reached the reef; it may be broken and have to be found underneath. A fault having been met with in the crosscut indicates the latter probability. At the surface where the principal shaft is located the outcrop 8 feet gave 15 dwts.; 190 feet west another shaft is being sunk in shales north of the reef, and 300 feet farther west is another. On Weltevreden the outcrop has been located at two places, and in both instances the reef shows well. To the east, on Waterval, the reef has been located in the same relative position to the Hospital Hill shales and pannings obtained. The old reef worked ten years ago on Sayman's portion of Weltevreden lies half a mile to the south of the new line, and the prospectors claim that their strike is a new one, no systematic work ever having been done on it before.

Personal.

A. A. BLOW, M. E., was in Denver, Colo., on the 9th inst.

J. P. EVANS, of the Colorado Iron Works, is on a trip through the East.

W. B. WILSON, Supt. Elkton mine, at Cripple Creek, Colo., has returned from Scotland.

E. E. CHASE, M. E., Denver, Colo., was recently in Butte, Mont., on professional business.

C. D. LANE, Woodson Garrard and party, of Angels, Cal., left for Alaska in the yacht Townsend.

J. M. HANAUER, Mgr. Hanauer Smelter at Salt Lake City, Utah, was in Denver, Colo., on the 8th inst.

R. H. CHANNING JR. has taken charge of the Highland Boy at Bingham, Utah, in the capacity of Mgr.

A. E. LINDROOTH, Denver, Colo., representative of the Link-Belt Machinery Co., Chicago, Ill., recently made a trip to Arizona.

HORACE F. BROWN, who recently furnished the plans for the mill for the Economic Gold Extraction Co. at Victor, Colo., has gone to Chicago, Ill.

R. J. WALTER, Mgr. B. & M. mine at Ward, Boulder Co., Colo., recently made mine examinations in the Black Hills and Bradshaw mountains, Ariz.

F. G. FARISH has resigned his position with the Grand Central M. Co., Ltd., of Minas Prietas, Sonora, Mexico, to take charge of the Humboldt mine at Ouray, Colo.

N. MANSFIELD, who for nine years has been Supt. Smuggler-Union mine, at Telluride, Colo., has resigned his position, being succeeded by C. W. Miller, formerly of Aspen, Colo.

Recent Mining Incorporations.

Manhattan G. M. Co., San Francisco; capital stock, $250,000—subscribed; C. E. Hegard, C. A. Kroch, C. V. Hegard, H. Boldt, G. E. Dangle.

Royal Oil Co. of Coalinga, Fresno, Cal.; capital stock, $500,000; subscribed, $25,000; C. A. Canfield, J. A. Chanslor, W. Easton, G. D. Easton, L. Phipps.

Black Hill Oil Co., Fresno; capital stock, $250,000; subscribed $100,000; L. S. Chittenden, A. L. Hobbs, H. J. Pfluger, H. Nathan, W. B. Holland, A. B. Smith, F. J. H. Manning.

Stanislaus Dredging Co., San Francisco; capital stock, $25,000; subscribed $12,700; N. M. Stover, C. H. Shorey, Sonora; C. H. Cornell, F. P. Bull, San Francisco; S. Goodenough, Oakland.

The Turner Oil Co., Los Angeles; capital stock $30,000, subscribed $8000; M. W. Turner, H. C. Turner, F. C. Turner, G. W. Brookins, J. T. Kirkwood.

Hanford & Oleander Oil and Mineral Co., Hanford; capital stock $320,000, subscribed $160,000; R. J. Wilson, W. J. Wilson, C. A. Lauder, H. C. Lauder, B. L. Barney.

Dolly Varden M. Co., San Francisco; capital stock $1,000,000, subscribed $5000; P. W. Johnson, E. A. Barber, W. A. Sabin, A. L. Black, H. S. Wilson.

Commercial Paragraphs.

THE Colorado Iron Works reports a strong demand and large sale of Bartlett concentrators.

THE Dillon Iron Works of Denver are making several of the Woodbury Imperial concentrators for Colorado trade.

THE Jeanesville, Pa., Iron Works Co. have received an order from British Columbia for three of their compound mining pumps.

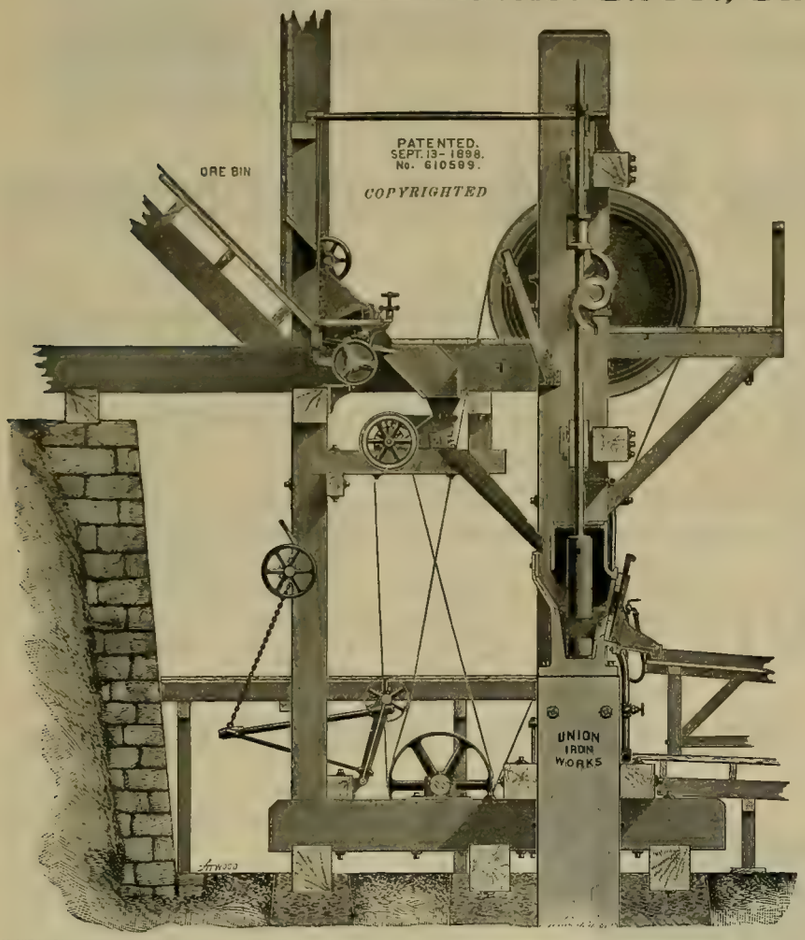
SKINNER & SETHMAN, Denver, Colo., agents for the Gates Iron Works, recently sent a Tremain stamp mill to a mine in Chihuahua, Mexico.

J. GEO. LEYNER, manufacturer of mining machinery, Denver, Colo., will soon move into his new shops at Thirty-sixth and Wazee streets, and into city offices in the Albany Hotel building.

THE Denver Engineering Works reports a heavy demand for Cammett concentrators, manufactured by them at the rate of thirty per month. Tables of this make were recently shipped to Breckinridge for the Mountain Pride mine and the Ault-Wilborg Co. They are building three 150 H. P. double drum electric hoists for the Le Roi mine at Rossland, B. C., and report fourteen sets of rolls in process of construction; also the building of a double 12x18 steam hoist, twenty-four special ore cars, six electric mine blowers and three electric incline hoists for points in State of Durango, Mexico. They have built a Loder pyritic smelter to be erected at Kokomo, Colo., and are building one of the same type, having a 200-ton furnace, for parties near Atlanta, Georgia. This kind of furnace, it is claimed, effects a great saving in fuel. They recently filled orders for three cars of water jackets for Colorado smelters.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.



THIS ILLUSTRATION

Shows our patent Improved Stamp Mill, with Secondary Crusher, which increases the capacity of the ordinary stamp battery from 25 to 30 per cent.

We respectfully invite the attention of those contemplating the erection of new mills to this practical improvement.

For particulars address

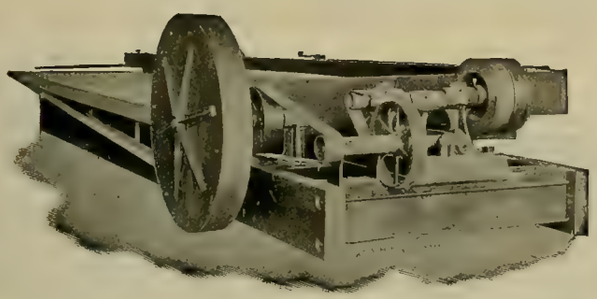
Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.



The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HAY RAKE ATTACHMENT.—A. F. Martin, Chester, Cal. No. 626,434. Dated June 6, 1899. This invention is designed as an improvement upon spring tooth hay rakes and consists of one or more wire guards extending across the arc of the outer teeth of the rake which act to prevent the hay at the ends from falling or being dragged out. These wires have a certain portion of their length made elastic, and there are connections on the exterior teeth of the rake which form attachments for the ends of the wires, these connections being so disposed that the wires extend in an approximately vertical position from the upper part of the tooth to points adjacent to the ends. The spring of the teeth is thus not interfered with, but the wires prevent the hay from falling out at the ends.

TIRE BOLT WRENCH.—Thomas E. Stockford, Leesville, Cal.; one-half assigned to Chas. E. Stockford of Sulphur Creek. No. 626,446. Dated June 6, 1899. This invention is for the purpose of securing and removing the nuts upon tire and similar bolts. The nuts are screwed on very tightly after being driven through the tire and felly, and it is difficult to remove them when it is necessary to take off the tire. This wrench has a hollow head adapted to fit over the inner end of the bolt, an arm swiveled to the head carrying a screw at the outer end and turnable to adjust the screw in the line of direction with the bolt. The screw is adapted to press against the head of the bolt and lock it in place. A nut wrench is turnable within the hollow head and has a socket fitting the nut, the shaft of the socket being in line therewith, and a means for turning the shaft so as to transmit its motion to the nut wrench. These means consist of ratchet wheels fixed upon the shaft, pivoted pawls, the points of which engage with opposite sides of the ratchet, and a spring which engages the pawls with the ratchet. A transversely movable screw is so disposed as to alternately engage one of the pawls and lift the other out of engagement with the ratchet so that the apparatus will work equally well to turn the nuts on or off of the bolts.

SEEDER ATTACHMENT FOR GANG PLOWS.—James E. Beach, Routier, Cal. No. 626,453. Dated June 6, 1899. The object of this invention is to provide an attachment for gang plows which serves to deposit the seed after the plow has passed. It consists of a braced bar fixed to the plow frame and extending rearwardly therefrom. The seed box is supported upon the rear end of this bar and has connections by which it may be tilted thereon. The feed for the seed is driven by contact wheels which may be made to engage or disengage as may be desired, by the tilting of the seed box so as to bring these wheels into or out of contact.

WAVE POWER PUMPING APPARATUS.—J. E. and W. Armstrong, Santa Cruz, Cal. No. 626,452. Dated June 6, 1899. By means of this apparatus the force of the rising and falling water or swell acts to operate a pump or pumps. The arrangement consists of independent vertical wells, one of which has a direct connection with the sea, and within it is a guided float adapted to rise and fall by the action of the waves. A pump is fixed in the other well and connections are made between the float in the outer well and the pump plunger of the inner one. A supply pipe or passage connects the two chambers at a point above the bottom, and is provided with an inwardly opening valve which supplies water to the inner chamber and prevents its escaping again. At the bottom of the chamber is another passage having an outwardly opening valve, and controlling gates so that the water which is contained in the inner well may at any time be used to flush out and clean it by opening the lower passages. The action of the waves upon the float in the outer chamber will cause it to rise and fall and the connection between it and the pump in the inner chamber will constantly actuate the latter and cause it to throw a steady stream of water which is conducted to any desired point by suitable pipes. The water thus stored may be used for power or other purposes.

HAND BRACE DRILL ATTACHMENT.—W. H. Ames, Watsonville, Cal. No. 626,474. Dated June 6, 1899. This invention relates to an attachment for the ordinary wood-boring, bit-holding stock or brace by which it is made capable of use in connection with a metal-boring bit. The boring brace has a drill clamp at the lower end, a screw-threaded sleeve enclosing the upper part of the clamp, and an interiorly screw-threaded extension fitting and movable upon the sleeve to increase or decrease its length. A flexible connection is made between the part to be drilled, and the attachment upon this extension by which the length of the flexible connection is adjusted. A ball-bearing casing fits in the upper part of the sleeve, one part bearing upon the upper end of the drill clamp and the other being supported within the sleeve and turnable therewith. A lever is fulcrumed to the brace in such a manner that it can be moved into line with arms which radiate from the upper end of the sleeve so that by contact of these arms with the lever the sleeve may be turned in unison with the movements of the brace and the yoke thus advanced.

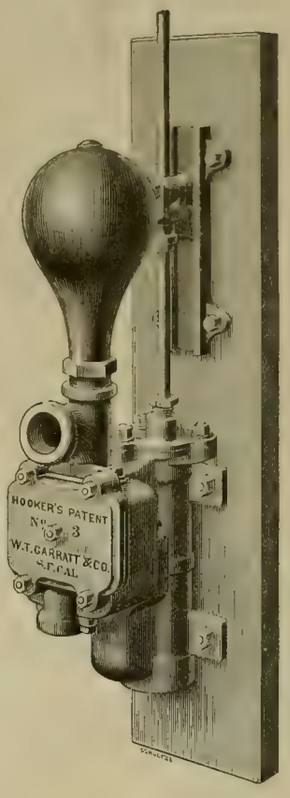
FILTER.—E. R. Cook and S. L. Cohoon, Sacramento, Cal.; one-third assigned to Thomas Scott, same place. No. 626,487. Dated June 6, 1899. The object of this invention is to provide an automatically self-cleaning filter, and means by which it is thus cleaned whenever water is drawn through the apparatus. It comprises an inner hollow filtering cylinder with a discharge opening, an outer casing with supply passages to admit the water to be filtered between itself and the filter, brushes adapted to contact with the surface of the filter having swiveled arms by which they adjust themselves as they move about it, and a driving mechanism actuated whenever the faucet is opened to cause these brushes to rotate and thus brush off the outer face of the filter to prevent any gathering of sediment or deposit thereon. The mechanism for driving the brushes may be a bucketed wheel loosely turnable and so connected as to carry the brushes with it. Jet tubes discharge water into the buckets of the wheel whenever the faucet is opened and thus cause it to operate.

ICE CREAM MOLD AND MEASURE.—F. E. Schmits, Oakland, Cal. No. 626,468. Dated June 6, 1899. This invention relates to a device for measuring and molding ice cream, water ice and similar condiments, and a means by which the material thus molded is afterwards loosened and discharged from the mold. The mold and measure may be of any suitable or desired shape, and preferably as scrapers pivoted and turnable within it. A polygonal stem to which the scrapers are fixed extends axially outward through the end of the mold, a pinion journaled in line therewith has a socket with which the steam engages and other pinions engaging it are actuated by a movable handle so that when turned the scrapers move around the inside of the mold and attach the contents which can thus be discharged. One of the handles for holding the device is stationary, while the other which is fixed so as to turn the train of gearing, is movable and may be operated by one hand. A suitable clutch mechanism causes it to engage and rotate the scraper arms when the handles are pressed together, and they are allowed to remain stationary when the handles are separated by a spring which acts for that purpose. The device can thus be operated with one hand, leaving the other free for other purposes.

HEATING FURNACES.—A. Johnson, San Francisco, Cal.; assignor to the Oil Fuel Saving Co. of same place. No. 626,465. Dated June 6, 1899. This invention is especially designed to be used in conjunction with furnaces where heat is required, either for making steam, or for roasting or smelting ores, or any other uses where heat and perfect combustion are required. It consists of a main combustion chamber, a communicating primary combustion chamber below the front portion thereof, a discharge pipe, oil and air supply pipes, connections between these and a transverse pipe so that the air admitted through the air pipes will be delivered into the discharge pipe, mixing and delivering with the oil which is delivered therefrom.

CONCENTRATOR BELT.—George Gates, Jackson, Cal. No. 626,461. Dated June 6, 1899. The object of this invention is to provide an endless traveling belt with a surface upon which a separation and concentration of heavy, valuable substances can be accomplished and such separation made more closely than with the concentrators now in use. It consists of an endless, longitudinally inclined belt having a series of wide, longitudinally inclined surfaces with shallow, vertically connecting offsets; drums upon which the belt is movable, these drums being so disposed that the belt surfaces have a slight backward inclination toward the foot of the preceding offset or step so that extended surfaces are formed for the settling of the sulphurets upon the tables while the lighter pulp will flow over the surface of the sulphurets and discharge onto the next table, each table thus retaining a bed of sulphurets which are eventually carried up by the travel of the belt and delivered in the usual way over the upper end.

Another Kind of a Sinker.



The Hooker Double Acting Pump.

Well built, simple, durable, efficient.

All working parts easy of access.

Duplicate parts in stock.

We furnish these pumps with suction pipes, hose and strainers complete. Estimates on application.

Can furnish up to number three with double brake for hand power.

Just the pump for a small mine. Larger sizes, larger capacities.

Our 1899 catalogue tells about over fifty different kinds of pumps. Sent on application.

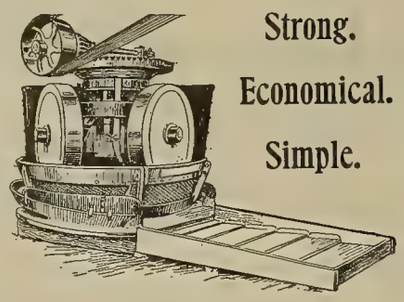
THE BRYAN ROLLER QUARTZ MILL.

We are the sole manufacturers of this Mill. A test made by the Bullion-Beck Co. of Eureka, Utah, with this and the Huntington Mill proved conclusively every claim we made for the Bryan Mill, viz: that the Bryan would crush more ore with less repairs, less power and less slimes than any Mill made. Result—they are now operating three of the five-foot Bryan Mills and find them superior and more satisfactory than any Mill they ever used. L. C. Trent & Co., who had formerly sold the Huntington Mill, immediately manufactured a Mill infringing our patent. Suit brought in the U. S. Court resulted in a verdict in our favor, and we shall prosecute to the full extent of the law any infringement of any character whatsoever in the MAKING, USING or SELLING of the same. : : : : : : : : : : : :



Strong.
Economical.
Simple.

MANUFACTURED BY

The BRYAN MILL is constructed on the principle of the Chili Mill, except it has three rollers arranged to run in a continuous discharging pan. It crushes either gold or silver ores. It consists of an annular cast-iron mortar with fixed steel dies arranged in the path of its three crushing rollers. Power is applied direct from a pulley through a bevel gear and pinion secured to stationary center post. We present a few of many advantages it possesses over any other Mill: Larger screen capacity and free discharge. Amalgamates a larger percentage of gold. Quickly and cheaply erected; with regular feed and proper flow of water requires little attention. Crushes hard or soft ore with smaller amount of power per ton and less wear and tear of machinery. : : : :

Mines and Machinery for Sale at Public Auction.

The Harqua Hala (Arizona) Gold Mining Company will on Monday, August 14th, 1899, at 12 o'clock noon of that day, at the Court House door at Yuma, Arizona, offer for sale to the highest bidder all its mines, mill site, pumping plant, 40-stamp mill, cyanide plant, engines, boilers, machinery (fixed and movable), and stock of merchandise situated at Harqua Hala, Yuma Co., Arizona. Inventories and information may be obtained from C. Dallman, agent at Harqua Hala, or Lindley & Eickhoff, attorneys, 530 California St., San Francisco. Terms of sale: Cash, U. S. gold coin, payable twenty per cent on acceptance of bids, balance on delivery of possession. Title to mines U. S. patents. By order of the Board of Directors.

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'S Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

DEWEY, STRONG & CO.,
PATENT AGENTS,
330 Market Street, San Francisco, Cal.

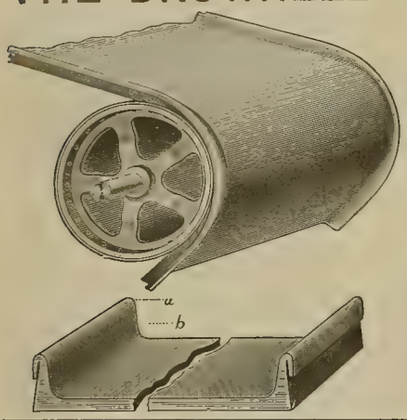
THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.



It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

SUPT. OFFICE WILDMAN GOLD MINING COMPANY,
SUTTER CREEK, AMADOR CO., CAL., Feb 22, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: Replying to your favor of the 18th inst., will say that in the two mills operated by this company we have nineteen of your Patent Lip flange concentrator belts in use; some of them have been in constant use for the past two years and have given entire satisfaction. I know of no better flange for a side shake machine.

Yours truly, JOHN ROSS JR., Superintdenent.

MEXICAN MILL. EMPIRE, NEV., March 28, 1897.

MR. J. S. BROWNELL, San Francisco, Cal.—DEAR SIR: For some years we have used three different styles of belts on our Frue vanner at the Mexican mill, and for smooth working and endurance the Brownell Patent Lip flange belt has proved its superiority over all others, and I unhesitatingly recommend it to all who are using Frue machines.

Yours truly, EUGENE MAY, Foreman.

AND PACIFIC ELECTRICAL REVIEW.

No. 2033.—VOLUME LXXVIII. Number 25. SAN FRANCISCO, SATURDAY, JUNE 24, 1899. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

An Auxiliary Pneumatic Hoist.

In accordance with its usual custom of illustrating any new device that appears to be of practical value to miners, the MINING AND SCIENTIFIC PRESS herewith illustrates and describes a new pneumatic hoist, built for the Gwin mine, Calaveras county, Cal., by E. A. Rix of San Francisco, Cal. It has many novel features. The primary idea was to construct a hoist that would not be excessive in weight; that would handle from 700 to 1000 pounds readily; that was protected from water and dirt and that had no great amount of inside operating devices such as levers, ratchets, etc., and small enough in dimensions so that it could readily be run through the drift on a flat car.

This hoist has an 18" drum with capacity to carry several hundred feet of ½-inch flexible steel rope. The drum is turned and nicely balanced so that it will run easily. It is loose on the main shaft and is connected thereto by a clutch mechanism which operates through the center of the shaft, a small hand wheel fastened to the center of the shaft being used for throwing this clutch in and out, the hand wheel turning with the shaft whenever the mechanism is in operation. By using this device there are no clutch-throwing mechanisms required. The clutch is never thrown in and out excepting when the gipsy is required for pulling timbers and ordinary hemp rope can be used.

The brakes are maple blocks clamped between wrought iron bars, and the operating mechanism for these brakes has a left and right hand 1½" screw with the hand wheel as shown. A very slight motion of this hand wheel is entirely sufficient to clamp the brakes in position and hold them there, no ratchets nor levers being at all necessary.

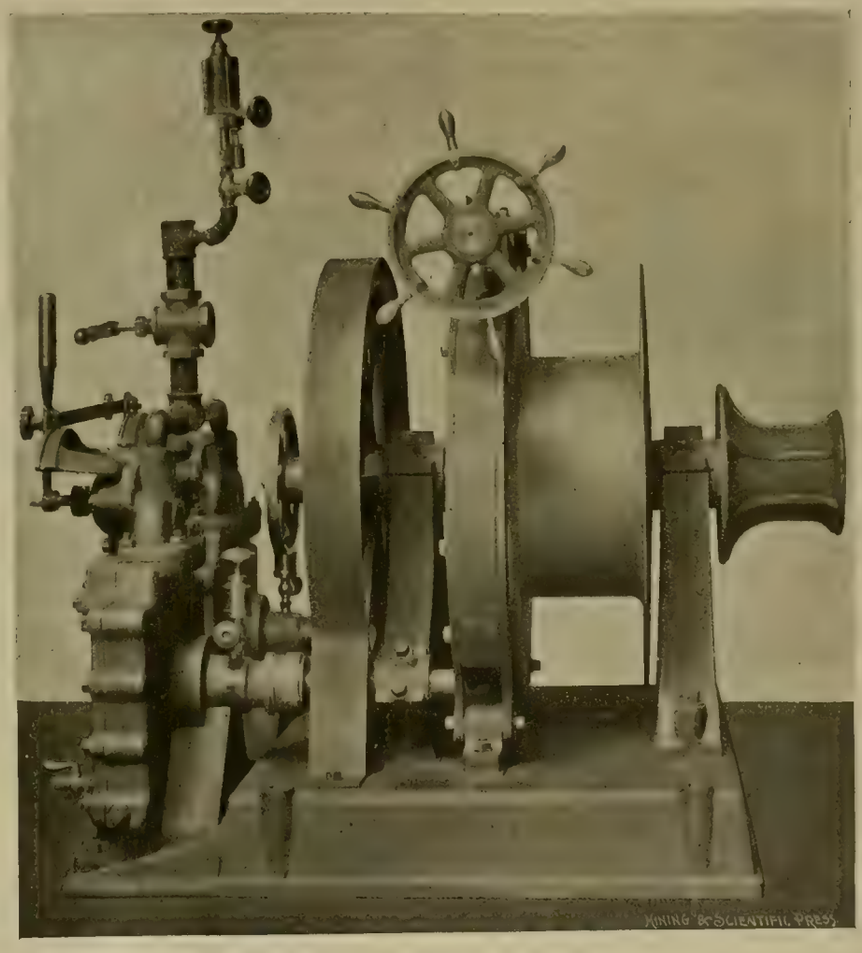
The main driving wheel is a spur gear about 30" in diameter with cut teeth. This gear has meshed into it two cut-steel pinions, which are fastened independently to two Dake engines of 7 H. P. each. These engines are of the enclosed type, as shown in the illustration. It is not a rotary but a reciprocating engine, the same as any other engine, with the exception that the pistons are doubled within the case, there being one horizontal and one vertical piston attached to the crank pin. It takes air on one side of each of these pistons during half of the revolution and on the other side of the pistons during the other half, thus there are no centers on either of the engines, and there being eight impulses on one revolution delivered by both of these engines the pressure on the gear is well divided and it runs easily and smoothly.

There being two points of application on the main gear wheel the strain on the teeth of the wheel is reduced one-half and there is no position at any time when the hoist cannot easily pick up the load as steadily as when in full speed.

Reversing is accomplished by the moving of the small lever on the extreme left of the illustration. There are no operating mechanical devices on the reverse, it being simply a change of ports. The gear wheel is boxed in with a wrought iron cover and the rim also.

The pair of engines shown in the engraving are simple engines. They can be made compound for larger hoists of the same description. A larger hoist recently furnished for the North Star mine, Grass Valley, Cal., to operate their manway, is made after the same plan, with the exception that there are four of these engines, one used for the initial cylinder and the other three for compounding, the air being reheated before passing into the initial cylinder and also before going into the compound cylinders.

This small hoist does not need to be accurately set for its operation but can be left on a flat car and held in position by a jack screw to the roof of the drift.



PNEUMATIC HOIST IN USE ON THE 1400 LEVEL OF THE GWIN MINE, CALAVERAS COUNTY, CAL.

The usefulness of auxiliary hoisting engines in the lower levels of mines can scarcely be overestimated. In the history of every large mine a time comes when sinking in the main shaft is discontinued, and, as time passes, the upper levels, already opened, are stoped, and the hoisting machinery, being already taxed to its fullest capacity, or near it, a renewal of sinking operations is delayed, for the reason that it cannot be continued without interfering seriously with operations above. The cages or skips are required in hoisting ore, waste and refuse of all kinds. Quantities of timber and supplies are required in the mine and must be lowered through the shaft. This condition of affairs, under some management, continues in the hope, perhaps, that large bodies of ore may be opened, which will afford sufficient material to keep the mill supplied without doing deadwork, and a skip can then be spared to resume sinking. Often this much desired condition does not materialize, and the time eventually arrives when sinking must be resumed or the mine shut down. Too often the necessary precaution of keeping exploratory work well in advance of exploitation is neglected so long, that the mill must be closed down and miners laid off while the shaft is being sunk another hundred feet or so and a new level opened. The introduction of such an auxiliary hoist as that at the Gwin mine, Calaveras Co., Cal., obviates such stoppage of work, and, if the step be taken in time, the mine may be operated regularly and the mill kept supplied constantly with ore.

When the auxiliary hoist is installed it is placed opposite one compartment of the shaft, that compartment being bulkheaded above for the purpose of safety, and in that compartment no hoisting is done from a point lower than the next level above the auxiliary.

Sinking is resumed, and all rock hoisted by the auxiliary is dumped into the ore pocket cut beneath the station in which it stands, from which it is reloaded into the skip from the surface, running in the adjoining compartment. When sufficient progress has been made in sinking, this compartment may be bulkheaded below the loading chute, and miners can then work in safety, so far as the falling of rocks from above is concerned. If the shaft has three compartments, the third compartment, containing the water column and other pump and ventilating pipes, is carried down at the same time and in no way need interfere with hoisting operations either from the surface or at the auxiliary. It may also be employed in sinking winzes and in underhand stoping operations on any level.

Patents for Pacific Coast Inventors; Notices of Recent Patents, 669.

COLORADO courts will pass upon the constitutionality of the eight-hour law. When this is done the mining industry will receive renewed impetus in that State.

AS MIGHT have been anticipated, many of the copper stocks which a few weeks ago soared to figures higher than they had ever before touched, have subsided to a much lower though still high price. The promised 25% premium on amalgamated copper stock has dwindled to a 15% discount.

PRICES of iron and steel are still advancing with every probability that they will go higher, as the demand is showing no decrease. It is reported several English ships are expected to arrive at Philadelphia within a few days all loaded with iron ore from Turkish ports, the mines being near the Black Sea.

SO LONG as war continues and the rumors of war multiply, there is little likelihood of a fall in the price of copper. It is reported that England has discontinued the manufacture of cartridges for the present, but it is still a large industry in the United States, and, as it looks now, is more than likely to soon become again an important industry in England.

THE danger arising from carelessness in handling nitro powder and in keeping it in places unsuited to it was exemplified a few days since at the Greenhorn mine in Siskiyou Co., Cal., when a fifty-pound box of powder which had been left in the changing room, where the sun would shine upon it, exploded. Powder should be kept in an underground or stone magazine where the temperature is normal and has but little range. Those interested would do well to read the article, "How to Store Powder," on page 261 of the issue of Sept. 10, '98, in which an expert on that subject gives full directions concerning this important matter.

EACH steamer arriving at Puget Sound ports is reported to carry hundreds of thousands of dollars' worth of gold nuggets from Klondike and other Alaskan gold fields. It will be remembered that the past two years the same stories were given wide circulation, but official returns have shown how grossly the gold production of Alaska and the Northwest Territory has been exaggerated by those interested. While these stories of gold are being freely circulated by the newspapers, the same papers contain pitiful tales of the privation, hardship and sickness endured by many in that northern land whose quest for gold has been fruitless.

Liquid Air Sensationally Treated.

Much is popularly claimed for liquid air that can not be scientifically considered. This is usually the case with all new things in science. The sincerity of those who make many unwarranted assertions is not questioned, but the inaccuracy of such statements is manifest. Hasty conclusions formed from insufficient knowledge of the subject are extensively published, and all sorts of extravagant assumptions announced. Mining, particularly, is to be simplified; power to be produced more cheaply than ever, and the atmosphere is to be the simple source of supply. Pseudo-scientific articles in popular magazines and Sunday newspapers have it all figured out how one gallon of liquid air will make in a proper machine three gallons, and these three will make nine by due manipulation, and thus, one can get enough power for 20 cents to run a 10,000-ton steamship across the Pacific to the Philippines.

Such chimeras are interesting, and, when well told, sell the publication in which they appear. That seems to be the intent; anyhow it is the result. The facts, however, are not parallel with the statements.

Air has been cooled, compressed and liquefied; that has long been an accomplished fact; when warmed and evaporated such liquefied air, of course, produces enormous pressure which is a source of power, expansion being converted into mechanical energy, and, if economic conditions can be made favorable the commercial value of this correlation of forces will be considerable. That is all there is to it.

But to assume that a liquid air engine can draw its power from the surrounding atmosphere, or that air can be liquefied at trifling primary expense and the process be made a self-acting and continuous one, is merely talking in ignorance or defiance of the first principles of science.

If mere amusement or the display of a fanciful imagination be the motive, there is little harm in the ridiculous articles and pictures now appearing treating of liquid air and its possibilities. But no scientific good can accrue from the publication of the current absurdities, nor is it likely that any mining or scientific reader will "take any stock" therein.

Secret of the Swansea Process.

A Seattle, Wash., correspondent writes:

"Some time ago we were informed that there was at the present time a class of twenty young men from this country at Swansea, Wales, learning the secret process by which they have been treating ores at that place for years. Our informant stated that the parties owning the secret had made all the money out of it they desired, and, as they were getting old, thought it too bad to have the secret die with them, and had therefore decided to make the process of treatment public for the use of future generations."

It is not in the least improbable that there are twenty or more American students at Swansea, Wales, studying the treatment of ore as practiced in those works; but that they have a secret process which has so long been zealously guarded is improbable. In recent years metallurgy has made such rapid progress throughout the world that it is unlikely that the Swansea reduction works have at this time a process superior to that used in other large establishments of similar character elsewhere. The secret of their success lies in part, perhaps, in their possibly having anticipated some features of modern practice in America, but more largely, no doubt, in the close attention given to detail and in cheaper labor and fuel. It is also very unlikely that, had they a secret process, so long valued, even at this late day they would care to make the secret public, for fear that their death would deprive the world of its benefits.

THAT the strained condition of affairs existing between England and the South African Republic are daily becoming more serious is plainly apparent. Should war be declared, the strife would probably be long and serious, involving great loss of life and an enormous expense to England, owing to the climatic conditions and the fact that the Transvaal is an interior country, difficult of approach, and thousands of miles from the base of supplies. That the difficulties will be peacefully adjusted without war there now seems to be little hope.

The Cause of Failure.

When a mine fails to pay there are always numerous excuses to offer for such failure. One most commonly heard is that the "old rattletrap of a mill" would not save the gold. It is a well known fact that some of the simplest and most primitive mechanisms save free gold closely when properly manipulated, and an old rattletrap of a mill can still be made to do good work if there are no holes in the bottom or sides of the mortar, though it may not have as high an efficiency as a more modern mill. The fault usually lies either with the men running the mill or in the ore being too poor to pay, unless it be unsuited to free milling process, when the finest milling machinery will do no better. Another excuse for failure is bad management. It is undoubtedly true that many good mines have been ruined or at any rate temporarily shut down by reason of bad management, but a really good mine will stand considerable bad management. It is the poor mines which will not pay under any management that are grossly mismanaged and large sums of money extravagantly expended.

ON pages 686, 687 and 688 appears the index of the preceding six months, Volume LXVIII, which closes with this issue. Like its 77 predecessors, it is of great value to the thousands who file their copies, and who want to find some information without the tedious process of hunting through the 688 pages of the volume. These three pages deserve a few lines of reference. They are a directory to much that is worthy of note concerning progress in mining, the latest in metallurgy, and everything that is of direct or indirect interest to mining men anywhere and everywhere. The miner, electrician, machinist, manufacturer or merchant; the assayer and chemist, or mining engineer; the superintendent, mill man or foreman; the prospector, mine owner, mine seller or mine buyer; the geologist, official or public incumbent, all find much of practical value made more readily accessible by means of the index. The volume is, as usual, a mirror and summary of what is worth knowing in the mining world during the past six months, and the index is a ready means of finding whatever is wanted therein at a minimum expenditure of effort.

OUR special Colorado correspondent in this issue states the existing conditions of the present serious industrial problem in that State. As was anticipated, the wiser counsels appear to have prevailed to a great extent, and what threatened to become a very serious matter is now in a fair way for a speedy and satisfactory adjustment. The present scarcity of lead ores is being felt by the smelters, and even when the labor troubles are adjusted it may be some time before all the smelters can operate to their full capacity. The Cœur d'Alene region has for some time past supplied a large amount of lead ore, but the labor troubles in that section have deprived the reduction works of the customary supply. Some of the mines are starting up again, however, and the much needed fluxing ore will probably soon be obtainable.

THE city of San Francisco proposes to manufacture hydrants for municipal use. That is, certainly, the way to build up manufacturing industries. Give monopolies perpetual right to charge high prices for prime requisites, heavily assess manufacturing sites and plants, and then when local concerns employing labor, which is the life of a city, bid on local work, find a way to "save" some valuable cents by turning the work over to a ring-ruled government employing men not for their skill or fitness, but because of their "pull," with the usual result—inferior work at an ultimate cost in excess of that charged by those in the regular business.

GOV. MURPHY of Arizona has not transcended his authority or jurisdiction in issuing an official warning to investors against fraudulent mining companies operating in that Territory. It is part of the duties of a territorial executive to aid in the development of the country's resources, and in attempting to check fraud and injury to the Territory's advancement, his recent action is worthy of approval by everyone in Arizona who feels an interest in the proper advancement of that great mineral region.

Concentrates.

TOWNSITE authorities cannot interfere with placer mining on public lands.

A SITE for pumping works in connection with a mine may be taken up as a mill site.

A LIEN may be taken by workmen on a mine not located on an agricultural patent or on a Spanish or Mexican grant.

AN official survey of a mining claim must be made in accordance with the location notice upon which the survey is ordered.

VALUABLE mineral must actually be found on land before its mineral character will be recognized by the land department.

ABOUT 150 are expected to attend the September meeting of the American Institute of Mining Engineers in San Francisco.

DEPOSITS of slate on land in California not valuable for agriculture should be entered under the timber and stone law, not under the general mining law.

CYANIDE OPERATORS should be careful to secure the best and highest grade of potassium cyanide, as it is cheaper than lower grades which sell at a lesser price.

GOLD as it comes from the zinc boxes is sometimes mixed with copper and smelted, the two metals forming an alloy. Separation is effected later by electrolytic process.

THE paid-up capital of the American Smelting Co. is $54,795,000. Of this $47,090,000 represents money paid for the several properties in the combine and $7,705,000 cash paid in.

WITHIN the limits of the city of San Francisco, Cal., occurs a high grade manganese ore, cinnabar, hematite and gold, but none of these have as yet been found in payable quantity.

MISSOURI and Kansas lead miners are now employed in the Cœur d'Alenes, Idaho. Others are expected from Keswick, Cal.

WHERE a water right has been previously located and maintained the subsequent location of a mining or agricultural claim on the land by others does not deprive the original water locator of his right.

"EXPERIMENTER" will have an unsatisfactory experience with any admixture or contact of quicksilver and aluminum. The former metal will disintegrate the latter and dissolve it into fine, feathery powder.

TOWNSITES may be located on mineral lands. The question of relative legal rights of townsite and mineral claimants as to occupation or possessory title to surface must be determined by courts of competent jurisdiction.

IF an ore body lie upon top of the ground or has no other covering than superficial deposit of debris, it is not a lode or vein in the meaning of the law and the deposit cannot be followed outside of the lines bounding the claim.

A LOS ANGELES, Cal., miners' committee has issued an invitation to miners and others interested in the mining industry to meet there July 13th, to consider the question of forming a miners' association for southern California.

WHEN tailings are allowed to flow where gravity carries them without attempt at restraint or obstructions to confine them to proper limit it is considered an abandonment. Tailings thus disposed of may be appropriated by whomsoever claims them.

THE right to purchase mineral lands is restricted to citizens of the United States or those who have declared their intention to become such. A citizen of the United States cannot make a mineral location for the benefit of an alien corporation.

THE next session of the International Mining Congress (which met at Salt Lake City, Utah, last July) is billed for Milwaukee, Wis., August 16th–20th, '99, but it is not thought that the number of attending delegates will tax the capacity of the hall.

THE law requires that mining claims shall be staked so that its boundaries can be readily traced on the surface. A placer claim located in such a manner as to conform to the subdivisions of government survey for precautionary reasons should be staked.

UNDER such conditions as those portrayed by "Exeter," writing from Phœnix, Arizona, a gasoline engine would be satisfactory. These engines are now made to supply power at one-tenth of a gallon of gasoline per horse power per hour, and are valuable in regions where water is scarce.

WORK done on a ditch outside of a placer claim previous to the location of said claim cannot be claimed as expenditure to apply on patent, nor can the expense of preliminary survey for a ditch be claimed as required expense unless the ditch be actually constructed after location of the claim.

THE ore deposits of Leadville, Colo., are presumed to have been formed at a depth of 10,000 feet, the present position at and near the surface having been brought about by erosion largely through the agency of glaciers, remnants of which still remain. The town of Leadville is largely built on a glacial lake bed.

AN unpatented mining claim located on the public domain is not taxable, though the improvements in the way of buildings, machinery, etc., are. A claim on patented agricultural land is taxable in proportion to its area, being assessed at the same rate as agricultural land, the improvements being also taxable.

ACCORDING to the De Lamar, Nev., *Lode*, the "terrible mill dust" at the De Lamar mill, which is credited with causing considerable fatality, is now satisfactorily disposed of. The writer visited a chlorination mill at Florence, Colo., about a month ago, where some such contrivance as that at the De Lamar mill is badly needed.

LIQUID HYDROGEN has been successfully and repeatedly produced. Prof. Dewar of London is the most prominent in this connection. The matter is of little present commercial importance, but is of great scientific import, as it was the first element that had for many years defied all efforts at liquefaction. The temperature of liquid hydrogen is inconceivably cold—about as low as the assumed temperature of vacuity of space.

WHERE cyanide plants are operated in cold climates and difficulty is experienced with the freezing of solutions in pipes, vats, etc., exhaust steam if applied will remedy the difficulty. If steam is not used for power a small boiler might be installed for the purpose of making steam for this purpose, and would in most cases prove a paying investment.

NO ARBITRARY percentage of copper in ore can be fixed as the point at which such ore can be profitably mined and treated. As in gold and silver mining, the economic conditions surrounding the mine, the size of the ore body and the facility with which it may be reached and worked, are important considerations, as well as distance to market for the ore, transportation, etc.

AS FORESHADOWED earlier in the year, the Daly associated holdings in the Anaconda, Montana, interests have been sold to a Standard Oil syndicate for $23,000,000. Daly gets $6,000,000, Haggin & Tevis of San Francisco $17,000,000. A London concern owns a part of the stock, for which they paid $7,000,000 in '97. Daly is credited with intention to make his future residence in Colorado.

ALMOST any hard, dense rock in a thin slab will give out a ringing sound when struck, but this fact alone will not establish the rock as being phonolite. Eruptive rocks vary greatly in composition and graduate from one kind to another. The typical rocks which contain only the essential ingredients, as described in the textbooks, are rare. Phonolites is allied to trachyte, but is still a distinct class of rock.

THE Seattle, Wash., allegations of the arrival of Klondike gold should be seriously discounted by intending pilgrims to the Yukon region. So much has been said in these columns on that subject that it need only be necessary to point out the fact that the Seattle newspapers and the transportation companies are directly interested in keeping up the excitement, and it sometimes looks as though the Associated Press was in the plot.

THE latest authentic statement concerning the operations of the California Debris Commission appeared in an illustrated article in the issue of Oct. 22nd, '98. Nothing has since transpired to change the conditions expressed therein. Preliminary work has, however, been vigorously prosecuted, and the Commission expects this summer to announce definite plans regarding the site and mode of construction of barrier work.

NO PLACER mine location can be made by a single individual which shall exceed twenty acres in area, and no claim shall be taken by any association of persons greater than 160 acres, and such association shall not consist of less than eight individuals, who must be bona fide locators. No local laws or regulations of mining districts can restrict the size of placer locations to less than twenty acres, although the locator is not compelled to take that much.

TO PRINT the questions to which many of these "Concentrates" are answers would often take up more space than the answers themselves. Hence, usually, the answer alone, and that in briefest form, is given, the answer indicating of itself the nature and purport of the question, and serving as information and reply to many others who often have the same general question in their minds as that asked by the inquirer whose question is thus concisely answered.

THE $25,000 fountain to be placed in front of the MINING AND SCIENTIFIC PRESS office in San Francisco is the gift of the late J. M. Donahue, and is to commemorate his father, Peter Donahoe, who was the first foundryman, ship and railroad builder on the Pacific coast. The fountain will have a 40-foot granite base, 6 feet high. There will be five bronze figures, each 8 feet high, and a punching machine, 21 feet high, in bronze, the group being emblematic of the early days of California's mechanical industry.

WHERE A, B and C jointly own a quartz lode location, and A in doing assessment work finds a cross lode, he together with his partners owns this lode jointly to the side line of the claim. To make a separate, individual location upon this cross vein, a discovery must be made outside of the lines of the claim already located and a new claim located on this new discovery, but A. cannot claim separately and individually any portion of the vein lying within the lines of the original claim. His individual right ceases at the side line of the original claim, and is defined by a vertical plane along such side line.

A, LIVING in San Francisco, Cal., may give a power of attorney to B to locate, buy or sell mines or mining property in Alaska, and B may locate claims for A without power of attorney. A may go to Alaska and locate additional claims for himself. Should B return the power of attorney to A, A may continue to hold claims located for him by B, but as a precautionary measure it might be well to relocate. A placer claim need not be square, but cannot exceed twenty acres in size. Where the land has been previously surveyed by the Government, the claim must conform as nearly as possible to the subdivisions of the survey. No surveyed tract can be taken less than ten acres in extent.

FELSITE is an eruptive, intrusive rock, but is not known to be effusive. The statement that a large ore body exists in the crater of a felsite eruption at White Rock, Australia, is probably the result of mistaken judgment. It is more probable that the central portion of the felsite mass, where the ore occurs, having become fractured and crushed by dynamic force, afforded a condition for the deposition of ore from mineral solutions from below. These same solutions probably had a decomposing effect on the felsite, rendering it more easily subject to erosion, and this inner portion of the felsite mass having from this cause been eroded more rapidly than the outer portion resulted in the formation of a basin-like depression now mistaken for the crater of a volcano.

IN the manufacture of salt in Alameda county, Cal., numerous natural advantages assist in the process. The water is taken from the upper portion of San Francisco bay, where the percentage of salt is said to be somewhat higher than that of the ocean, probably due to evaporation and to the fact that no large fresh water stream enters at that end of the bay. At high tide the water is admitted to reservoirs through gates which are closed at flood tide. When settled and clear, the water is pumped by numerous windmills located on the dykes dividing the tract of land into several reservoirs. Evaporation rapidly raises the percentage of salt in the solution, and the windmills pump it from one reservoir to another until it becomes a saturated solution from which the salt crystallizes, and is raked up by workmen, refined and marketed.

IT is cheerfully argued by the Leadville *Miner* that the lockout of the smelter men in the State of Colorado and the consequent laying off of many miners is not an unmixed evil, as many of the men are now out in the hills and gulches doing their annual assessment work or work for patent. Much prospecting will also be done. The workingman is unlike the so-called capitalist, who when a period of depression comes along sits down and talks "calamity" and discusses the "intimidating of capital," but he generally hunts up a lease or goes out and locates a mine for himself. Successful mining men have not stopped any new development work, and will start work in contemplation notwithstanding all calamity talk, as they appreciate the fact that the present state of affairs has no bearing on new work, and that when they get ready to ship ore there will be a place to sell it.

THE Clark-Campbell mining stock litigation, previously referred to, has been decided against Clark. A. G. Campbell of Utah gave W. A. Clark of Montana an option on a controlling interest in the Ophir Hill M. Co. for $75,000. The stock was in escrow, the conditions being that if Clark or his agent paid for it on or before Nov. 24th, '98, it was to be delivered. On Nov. 22d, '98, a $19,000 dividend was paid to Campbell on this stock. On the 24th, two days after, Clark's agent made the option good, paid the $75,000, got the stock and demanded the $19,000 paid on it to Campbell while it was in escrow. This was refused, suit was brought, and last Saturday a Salt Lake City judge decided that Clark was not entitled to the $19,000 dividend, and that Campbell could retain it, on the ground that the title to the stock vested in Campbell till Clark made good his option and paid the agreed price when the stock was his, and not before.

THE Plattner chlorination process consists briefly in roasting sulphide ores with salt in a reverberatory furnace, from which it is withdrawn, cooled, dampened slightly and charged into a large circular tank provided with a false bottom. A cover is placed over the tank and chlorine gas is introduced from below. After twenty-four to forty-eight hours this is discontinued and the ter-chloride of gold washed out with water. The water containing the gold in solution is drawn off in another vat, in which the gold is precipitated by the introduction of iron sulphate in solution. This process costs in California, where it is the only chlorination process in use, from $5.50 to $10 per ton of ore treated, according to capacity of plant and cost of labor and supplies. When good work is being done, over 90% of the gold values are recovered. The largest plant in California is at the Utica-Stickle mines, at Angels, Calaveras county, where there are seven furnaces.

THE copper-bearing deposits of the Lake Superior region are of two classes, bedded deposits and veins. The former includes all of those occurrences in which conglomerates, sandstones, amygdaloids, and veins or beds containing much epidote, are copper bearing. The other class includes those fissures which traverse the bedded formations at or near a right angle. It is notable that no copper has ever been found associated with acid eruptives in this region, nor have any deposits sufficiently rich to pay ever been found in the massive non-vesicular diabase beds, excepting where directly connected with amygdaloid deposits or epidote courses. The conglomerate and sandstone deposits are of ordinary type similar to sandstones and conglomerates elsewhere, except that they are copper bearing. In the conglomerates and sandstones the copper occurs as a cementing material and as replacing certain portions of the beds which have been removed. The copper is of secondary origin and has been deposited in these fragmental rocks by deposition from copper-bearing solutions. The copper-bearing amygdaloids are much altered, copper-saturated upper vesicular portions of old lava flows, and are not independent beds.

WHEN a prospector locates a claim he should take particular care to ascertain, as nearly as possible, the direction of strike, that the side lines may be made parallel to the vein. The passage of the vein across the side line of a claim is disappointing to the owner of the claim and is also a fruitful source of litigation. The likelihood of making a mistake of this kind is greater in a region where ore deposits occur in a sedimentary formation that lies at low angles, as at Leadville, Colo., and in the Black Hills of South Dakota, where silver-lead and gold ores occur in quartzite and limestone in nearly flat sheets. The ore shoots are usually larger in one direction than in another and the larger axis may be presumed to represent the strike or trend of the ore body and in this direction the claim should have its greatest length. At least one famous law suit was indirectly the outcome of an error of this kind—the case of Dugan vs. Davy in South Dakota. The locator made a discovery on the side of a hill above an abrupt precipice. He considered the quartzite to be the vein and located his claim in the direction of its exposure or outcrop, taking one-half of its width on the quartzite and the other half on the steep slope and talus at its base. The ore shoot lay in this quartzite layer, but its trend was almost directly across the length of the claim, so the locator only had 150 feet on the shoot where he might have claimed and held 1500 feet.

THAT nuggets grow there is no reason to believe. All the so-called evidence to that effect is theoretical. When a nugget is released from the rock matrix in which it was formed, whether quartz, talc, or whatever it may have been, it begins to diminish in size by the attrition of rocks as it moves along and mingles with the detritus on the surface. It has taken ages in most cases for a nugget to move down a hill side from a vein where it was formed, but having reached the gulch and mingling with the gravel and boulders of the stream, every freshet which has volume enough to move the rocks, gravel and grit causes the nugget to be scoured and finally worn smooth. Its sharp corners and edges are blunted and any projections are pounded out of shape and sometimes turned back upon the main mass. In time the entire appearance of the mass of gold is changed from that of a rough mass of irregular shape, having sharp edges and possibly many crystal faces, is beaten and worn until it becomes a smooth rounded mass of still irregular shape. This may be accomplished without the nugget having moved along the bed of the stream at all, the attrition being due to passing rocks and gravel carried onward by the swift current of the mountain stream. In a gulch producing nuggets of gold as well as fine gold, it will be found that the gold always grows smoother and pieces average smaller as distance from its source increases.

Some Experiences of a Working Miner.

NUMBER XXI.

Written for the MINING AND SCIENTIFIC PRESS.

Two brothers, prospecting, one lucky day discovered the croppings of what is now the A—— L—— mine. They had little means and could not do much toward the development of a mine such as theirs—a great vein of low-grade gold ore. They worked vigorously, however, and soon attracted attention to their prospect. One day a stranger happened in the vicinity, and, hearing of the A—— L——, made an examination and finally bought the property—two claims—for $15,000. A corporation was organized and an Eastern gentleman was sent out to take charge; and he was a gentleman, too, and a most excellent dentist. The doctor was well liked by everybody; even the miners liked him, for he never troubled them in their work and was as well pleased when they drilled 18 inches on a shift as when they put in 8 feet. The first step was a first-class 40-stamp mill. The mine was not opened yet, it was true; but that was all right; there was plenty of ore, so it was believed, and the matter of development was a secondary consideration, which could be attended to any day when ore was wanted. In ninety days the mill was completed, and when a long tramway connecting the mill with the workings on the hill, was completed, too, mining commenced; but, somehow, it seemed hard to get down enough ore to keep the mill running steadily. The stamps were hung up, and in a few days the bins of the mill were full and the chutes at the mine were overflowing. Then a fresh start would be made; but this ore crushed rapidly, and the forty stamps ground up and sluiced out nearly 200 tons in twenty-four hours; so that, after a run of a day or two, the hang-up period came around again. It cost 75 cents to mine and deliver the ore in the mill and $1.25 to mill the ore. The clean-up showed about this amount in the ore. It was evident that the superficial excavation up on top of the hill would never make a mine, and the rock was low grade, anyway. It was a well known fact that mines grow larger and richer as they went down, and the Doctor started a tunnel. It was driven 1400 feet into the hill, and had it continued a little farther would have come out on the opposite side. One peculiar feature of this tunnel was that at no point along its line was it more than 60 feet below the surface, and the face of the tunnel had entered the alluvial deposit on the slope of the hill on the opposite side of the ridge when they quit.

This sort of thing could not last forever. The A—— L—— mine was declared no good, work was stopped, the mill was shut down and a few years later was moved away to another property. This was fifteen years ago. A few years later a miner took the property and started to work it in a small way—first with an arrastra and later with a rotary mill—and he has made money every day, and now he is preparing to build a larger mill. The tailings from the mill built by the corporation yield more than they got from the ore, and there is not a freer milling rock anywhere; but it would be hard to find a better dentist than Mine Superintendent M—— was.

* * *

M—— was a good miner and he thought he was a good mineralogist, too, but he wasn't. He had been in camp so long that he was looked upon as authority on any matter concerning the camp. One day M—— took a stroll up on the hills back of town and came across a stranger digging away as for dear life.

"Howdy, stranger," said M—— as he walked up, and stooping picked up a piece of the rock the stranger was carefully laying on a canvas.

"Howaryer," briefly responded the perspiring stranger.

"What are you going to do with this rock?" inquired M—— who was noted for his inquisitiveness.

"Ship it," was the reply.

"I wouldn't," said M——.

"Why not," inquired the stranger.

"It'll put you in the hole," said M——. "There's nothing in it—why that's only birdseye and never carries anything here.

"Bet yer it does," said the brief stranger.

"Oh," said M——, "it might carry a trace, but it won't go three ounces."

"Bet yer it'll go over thirty," said the stranger.

The wager was made. It was a thirsty country and it is not necessary to say what the wager was, but M—— lost both the wager and his prestige as an oracle. The "birdseye" milled nearly 300 ounces per ton. This simply goes to show how dangerous it is to presume to know it all even in your own camp.

* * *

One of the liveliest and most prosperous mining camps in the West was at C—— in its palmy days. C—— was built on a narrow strip of ground between two gulches, the sides of which were precipitous. Building room was scarce. Back of the town arose a steep, rugged mass of red rocks to a height of more than 1000 feet. No houses could be built there without an expensive grade. Many miners owned their cabins and "kept house" for themselves. One of them who had grown tired of boarding-house fare and Chinese cooking took a notion to build, but he was too poor to pay $150 for a lot. Noticing a pile of rugged rocks at the side of the street, at the upper end of the single village street, he thought it might be made a suitable place for a house with a little labor. He applied to the company owning the ground for permission to build, which was granted. He worked at his grade in the evening and early morning before going on shift, and was soon prepared to build his cabin. Being an observing fellow, he took more than passing notice of the rock in which he was excavating and finally concluded to test some of it. This he did in a simple way, and, becoming satisfied that there was pay in sight, asked for a lease. The company gave him the desired lease and agreed to mill all the ore he could get out. The leaser made a fortune right there, and the company enlarged its mill to accommodate the increased tonnage offered. The cabin site is a big hole in the ground, and all is still there now.

* * *

When the K—— mine was running in C—— a tunnel was driven 200 feet along the vein. The ore was at first good, but got poorer, and the vein finally pinched altogether, work was discontinued and the claim abandoned. Later it was relocated and some new exploratory work undertaken. A crosscut was run a short distance and a rich vein found. It is now known that the tunnel was run parallel with the main vein, and the original owners lost a valuable mine from neglect to crosscut.

* * *

The J—— Portland Cement Co. was organized and a deposit of material suitable for the manufacture of a first-class article was opened. Machinery was built and buildings for all purposes provided. That the product of the works was all that could be desired was abundantly proven, but the cost of taking the product from the lonely camp in the hills to market cost more than it did to make and transport the product of rival concerns and the enterprise was abandoned, after $80,000 had been expended on it.

MINER.

Operating to Great Depth by Relays.

Written for the MINING AND SCIENTIFIC PRESS.

A propostion to work mines to a depth of 8000 feet is now being considered in South Africa. That this can be accomplished by the establishment of relay winding stations at distances of 2500 to 3000 feet, and of pumping stations at half this distance, is manifest. Electricity must become an important factor in the development and operation of mines to great depth. It is the most rational and least expensive method of overcoming the problems of deep mining. An important question will be that of ventilation, but the introduction of electric fans is going to do something for ventilation also.

That the cost will be greater when operating by relays to the depth of 8000 to 10,000 feet than from a depth of 5000 feet—already an accomplished fact—goes without saying, but a single operation can be carried on to a depth of 10,000 feet at a cost considerably below that of operating two mines to a depth of 5000 feet each. A shaft started with the idea of deep mining should be large and provided with a sufficient number of compartments to afford large capacity. Having reached the depth of the first relay winding station—at say 3000 feet—it would be necessary to excavate a large chamber and support it by such means as would render it safe, dry and permanent. In this must be installed the first auxiliary hoisting machine, for hoisting from the level of the next relay station. If only one relay station is to be established, compressed air could be employed to advantage, but for all purposes—ventilation, pumping, hoisting, haulage, etc.—electricity would probably be the best, and in the event of more than one relay station it is undoubtedly the best.

When sinking shall commence below the level of the first relay station the shaft should be offset a distance sufficient to allow a space of not less than 5 feet between the two shafts. This partly as a precaution against accident to men on the station level and partly to avoid danger of a breach in the wall between the sump of the upper shaft and the relay shaft. Cars hoisted on the cages in the relay shaft could then be run onto the cages going to the surface, and hoisting continued without dumping or any further rehandling.

When the level of the second relay station has been reached a second chamber should be cut out and equipped in the same manner as the first, and the shaft again continued on an offset as above, being located either directly under the first section of the shaft or still farther over in the direction of the first offset. The character of the formation on the level would perhaps determine this.

This idea contemplates a vertical shaft which is sunk through barren rock to an ore bed or vein, as at the Lake Superior copper mines, or the mines of the Witwatersrand, in South Africa, though equally applicable to a vein having many levels. The same plan could be applied to inclined shafts sunk upon or parallel with the dip of a vein. The idea is susceptible of more or less change in the detail, as for instance where skips are in use instead of cages. In such case the skips would be dumped at the relay stations into bins on the level, or into pockets cut out under the floor of the level from which skips operating in the next section above would be loaded. Where extensive operations are contemplated, cages would prove the more economical whether in inclined shaft or vertical, unless the dip of the shaft be too low to admit of the use of cages such as are constructed for use in inclines.

The generating plant on the surface would have to be powerful enough to supply all the power required to operate all hoisting and pumping engines, ventilating devices, and should also do the hauling underground. The first cost of plant would be great, of course, but that the working expense would greatly exceed that at mines working from great depth by a single lift is improbable.

W. H. S.

The Situation in Colorado.

TO THE EDITOR:—The week ending June 17th was one of serious uncertainty in all circles associated with the mining industry, as a result of unsettled questions growing out of the operations of the eight-hour law, which became effective on the 15th. Within the week six smelting plants blew out their furnaces—the Globe and Omaha & Grant in Denver, the Pueblo and Colorado in Pueblo, and the Arkansas Valley and Bimetallic in Leadville, the one at Durango having ceased to operate the previous week. The Argo in Denver, known as the Hill smelter; and the Philadelphia in Pueblo, known as the Guggenheim plant, have virtually adjusted all differences with their employes and those two smelters have not ceased to operate. Their employes are working on the basis of three eight-hour shifts and it is my belief that when the plants now idle resume work it will also be on the eight-hour plan.

Mr. Guggenheim of the Philadelphia Smelting & Refining Co. offered the following schedule to his men on the 15th, which the latter accepted:

Front men, formerly $2.25 for twelve hours, $2 for eight hours.

Side men, formerly $2 for twelve hours, $1.80 for eight hours.

Charge wheelers, formerly $1.75 for twelve hours, $1.55 for eight hours.

Machine roasters, formerly $2.80 for twelve hours, $2.20 for eight hours.

Machine helpers, formerly $1.50 for twelve hours, $1.40 for eight hours.

The schedule offered by the Argo management does not differ materially from the above, and between the latter and their employes there appears to be amicable relations.

The issue between the six smelters of the American Smelting and Refining Co. and their employes is primarily a question as to whether the former shall recognize the spirit of the eight-hour law. At this writing a test case is being prepared, wherein it is designed to obtain a decision by the Supreme Court as speedily as possible as to the constitutionality of the law in question.

While all will be deeply interested in the interpretation sought from the courts, it nevertheless appears that the acceptance of the law by the two smelters that are now running and by most of the mills and mines of the State is having the effect of adjusting the mining industry generally to the eight-hour basis, which is likely to be adhered to, regardless of the fate of the statute involved. A system once established by mutual concessions on the part of employer and employe will need no statute to maintain it.

The concensus of expression among mine operators is that the eight-hour plan is not inimical to their industry; that by selecting men who are competent and faithful, and weeding out those who are not, the business will not suffer as a result.

At this date the attitude of the consolidated smelter management and their former employes toward each other is more conciliatory, and, through the mediation of disinterested committees of representative citizens, it seems probable that before the close of another week existing differences will be settled, with the result that the plants now shut down will resume work.

Meantime the output of the mines at Leadville, San Juan country, Creede and all other districts producing smelting ore and concentrates, is either greatly reduced or entirely stopped because of the interruption of smelting operations.

In Cripple Creek district many of the large mines, especially those which produce a high-grade smelting ore, greatly reduced their force the past week. Nevertheless, this district is more slightly affected by the disturbed conditions than any other in the State, because of the fact that there are five chlorination and cyanide mills, having an aggregate capacity of 28,000 tons of ore per month, all operating within and near the district, with a likelihood of one or two others being added to the list within two months. In fact the high saving effected by these plants and their adaptability to Cripple Creek ores is rapidly making them a controlling factor in the situation so far as that district is concerned.

Denver, Colo., June 17th, '99. WASCOTT.

Cyaniding Slimy Ores and Tailings.

Written for the MINING AND SCIENTIC PRESS by MATT. W. ALDERSON.

Part IV.—Precipitation.

The most delicate operation in cyanide work is recovering the gold from the solution. This is naturally more difficult in a decantation system than by percolation. In the latter the gold is concentrated. In other words, the amount of gold in a ton of solution will be greater than in a ton of the ore, the quantity of fluid used for any other wash being seldom in excess of half a ton to a ton of ore, and generally much less. With decantation, the reverse is true, the solutions must necessarily be dilute, as from two to three tons of fluid to each ton of ore are frequently used for each of the three successive washes.

The difficulties incident to the handling of such quantities of solution, containing oftentimes no more gold than solutions ordinarily contain after having passed an extractor, have been successfully overcome in South Africa by the Siemens & Halske process. This, at best, is expensive to install and expensive to keep up. Naturally a simpler method has been sought. Unquestionably a system requiring the use of chemicals would be preferable, even if for a few years it were more expensive. There would be the advantage of less cost for labor and for power and the prospect after a while of a reduction in cost of chemicals by virtue of increased demand, etc. I need not dwell on the difficulties incident to precipitation with zinc shavings; they have been described fully by able writers; but an experience at the Southern Cross mill, where the difficulties were due to different causes from those overcome two years previous at Iron Rod, led to such an important modification of my own practice that I have no doubt its recital may be of benefit to others.

Shortly after having started work at Southern Cross, I discovered I was meeting with the same difficulty other cyaniders had experienced before me: I was not making a good recovery of the gold obtained in solution. This was surprising, as the strong solution entered the extractor carrying four pounds of cyanide to the ton and the second solution never less than 2½ pounds. With such solutions I had never failed to do perfect work. Running a series of checks on the solution, I found the loss was not in the extractor but before the fluid entered it. Tests soon showed an appreciable quantity of alkaline sulphides in the solution, and to these was ascribed the reprecipitation. Attempts to keep them under control by the use of acetate of lead, the usual remedy in such cases, resulted in comparative failure. Recalling Prof. Christy's articles on precipitation by copper and its compounds (MINING AND SCIENTIFIC PRESS, Jan. 9th–16th, '97), I believed his scheme would lead me out of my difficulty. I had already given the articles a great deal of thought, believing they afforded a way of successfully handling dilute solutions, so I was eager for actual experience. Making a careful series of experiments, I soon determined that the gold could be dissolved from the tailings without difficulty from solutions not allowed to fall below half a pound of cyanide to the ton, and I ran charges with solutions of less than a pound to the ton. After a large number of experiments in the laboratory and in actual practice on vats containing eight to ten tons of solution, I was compelled to decide the scheme of precipitating by cuprous chloride, etc., at least so far as that particular solution was concerned, a failure. Prof. Christy says that by his own system and by that of Prof. de Wilde he had made numbers of experiments on solutions of various values and says: "I have found them both to remove the gold with a sharpness and completeness that is a great relief, after trying the other methods in use." In my experiments, I was unable in a single instance, by either method, to secure a perfect precipitation, the general average being in the neighborhood of 80%. Objection was made, when Prof. Christy's articles first appeared, that the expense for sulphuric acid would be prohibitive, but I did not find it so. Aside from imperfect work, as above, the scheme is practicable and not expensive, and I would not say that in more skilled hands or with solutions from other ores it might not be made to work.

There seemed to be no alternative but to return to the use of zinc shavings, and naturally the thought occurred: "Is there not some way in which precipitation can be secured with consumption of less cyanide?" The mill solutions could be used for about a week with comparative safety, after that the accumulation of alkaline sulphides was so great as to cause serious loss almost any time. Even if the ore was rich enough so one could afford it, he would not care to throw away every week solutions containing 50 to 100 pounds of cyanide. I was aware that some cyaniders in South Africa had succeeded in precipitating gold from solutions containing but a trace of cyanide on freshly turned zinc. (See "The Proceedings of the Chemical and Metallurgical Society of South Africa," Vol. I.) I was also aware that Alfred James held that satisfactory precipitation could be made from very dilute solutions under proper conditions. (See MINING AND SCIENTIFIC PRESS, March 13th, '97.) I was also familiar with the opinion of Radoe and later writers that accompanying imperfect precipitation is an incrustation on the zinc, consisting mainly of ferrocyanide of zinc (see "The Cyanide Process," Scheidel, page 50), and I knew that the principal object of using strong solutions was to keep this incrustation from forming. On a former occasion, when considerable copper showing was made on the zinc, an experienced cyanider had advanced the idea that my shavings were not fine enough, that the gold would attack the fine shavings and the copper the coarse. This was not a plausible theory; but to test it I took a number of the small zinc disks, left after the shavings had been turned off, and put them in different compartments of the extractor. Instead of getting a precipitation of copper on these disks, I soon surprised myself by finding I was getting gold. In the MINING AND SCIENTIFIC PRESS of Jan. 23rd, '97, is an account of attempts to precipitate gold on commercial sheet zinc brightly burnished. The writer says: "In no case was more than a trace of gold precipitated. In many cases, where the zinc was brightly burnished, not a trace of gold came down, and the strips weighed exactly the same to a hundredth of a milligramme before and after the test, and when dissolved in sulphuric acid left no trace of gold."

A number of times I have put disks of sheet zinc in my extractor, and if it was doing good work these disks would soon show the black coating that proves that gold is being precipitated. But my experience with these disks soon taught me something else. I found that the incrustation which formed on the filaments of zinc during imperfect precipitation showed plainly to the naked eye on these disks. They therefore serve as good indicators of the condition of the shavings. Again, I soon found by experiment that the usual theory that a strong cyanide solution dissolved this incrustation was not wholly true. If one will take an incrusted disk, presenting to the eye an appearance like the incrustation of lime on the inside of a kettle, and place it in strong cyanide solution, he will find that the incrustation is loosened and only partially dissolved; it rolls off the zinc in fine, granular particles. Many persons have taken this incrustation for lime, as it will effervesce when tested with hydrochloric acid, but further tests will show that it is not lime but principally zinc. As this granular substance assays about the same as the precipitate, the question naturally arises if it is not really such, and if the action of the strong solution is not so much to aid precipitation as to remove the precipitated gold from the zinc, leaving it in such condition that additional precipitation can take place.

In the light of these observations and reflections, I commenced an attempt to precipitate on zinc shavings from solutions containing one-half pound of cyanide to the ton, the zinc in the extractor being first allowed to stand for awhile in much stronger solution, to remove any incrustation which it might have on the surface. The venture was a success. Since then all my work has been done with solutions ranging in strength fron one-half pound to one pound, and as perfect work has been done in every way, both in getting the gold in solution and in precipitating it from the solution as when I was using solutions ranging in strength from five pounds to six pounds cyanide to the ton.

Fig. 6 is a cut of an extractor which handles successfully thirty tons of solution every twenty-four hours. It is 3 feet in width by 12 feet in length. The first four compartments are 18 inches by 18 inches, and the last three compartments are 12 inches by 18 inches. The tubs shown at the head of the extractor are settling tubs for the gold slimes, the principle of decantation being utilized for this as well as for other branches of the work.

Once every six hours about 1½ pounds of cyanide are placed in the entrance to the head compartment of this extractor. The fluid, passing slowly, is strong in cyanide for awhile, and any incrustation on the zinc is thus loosened. Where desirable to save in cyanide, about a pound of caustic soda is placed in the entrance to the head compartment in lieu of the cyanide. The action of this chemical on the zinc, as far as removing the incrustation is concerned, is practically the same as the cyanide, the object in using it being that it is much less expensive. While good work has been done in this way in runs of several weeks at a time, especially at the Southern Cross and Schmidt & Johns mills, by placing in the head of the extractor alternate doses of cyanide and caustic soda, with no objectionable features being detected, I prefer to use cyanide exclusively where it can be done economically, if for no other reason than to simplify matters and avoid any possible chance for undesirable chemical complications. If one is using a one-pound solution for agition and the consumption is from a quarter to a half of this, and the filling of the agitator after agitation is from the waste water vat, the gold solution may not carry half a pound of cyanide to the ton. As the cyanide is really more necessary in precipitating than in dissolving the gold, the solution would better be brought up to working strength, as many cyaniders do, before it enters the extractor, instead of afterwards. And it can be done with more satisfactory results in the way I have described than in any other with which I am familiar.

Scheidel says ("The Cyanide Process," page 35): "A white precipitate is constantly accompanying the reduction of bullion in the zinc boxes, undoubtedly the result of the action of alkali on the zinc and of the zinc-potassium oxide on the double cyanide of zinc and potassium, which is always present in the solution, forming the insoluble cyanide of zinc."

To my mind, the presence of this white precipitate is inseparably connected with defective precipitation. I know other cyaniders do not so view it, but if it were to show in one of my extractors I would say the zinc needed immediate attention. I have noticed that it forms on zinc left standing for some time in idle cyanide solution, an indirect proof that it comes from inactivity in one form or another. On its appearance I would see that the extractors were properly worked and no opportunity left for solution to pass without penetrating the entire zinc sponge. I might increase, temporarily, the amount of cyanide placed in the extractors. I would also test for alkaline sulphides and other possible interfering elements. Alkaline sulphides are present in many Montana tailings, and as an aid in counteracting their influence I would place three or four tablespoonfuls of acetate of lead in the head of the extractor three or four times a week. This will be found beneficial in any case where the precipitation is not as perfect as it should be.

The action of the gold solution on the zinc in the

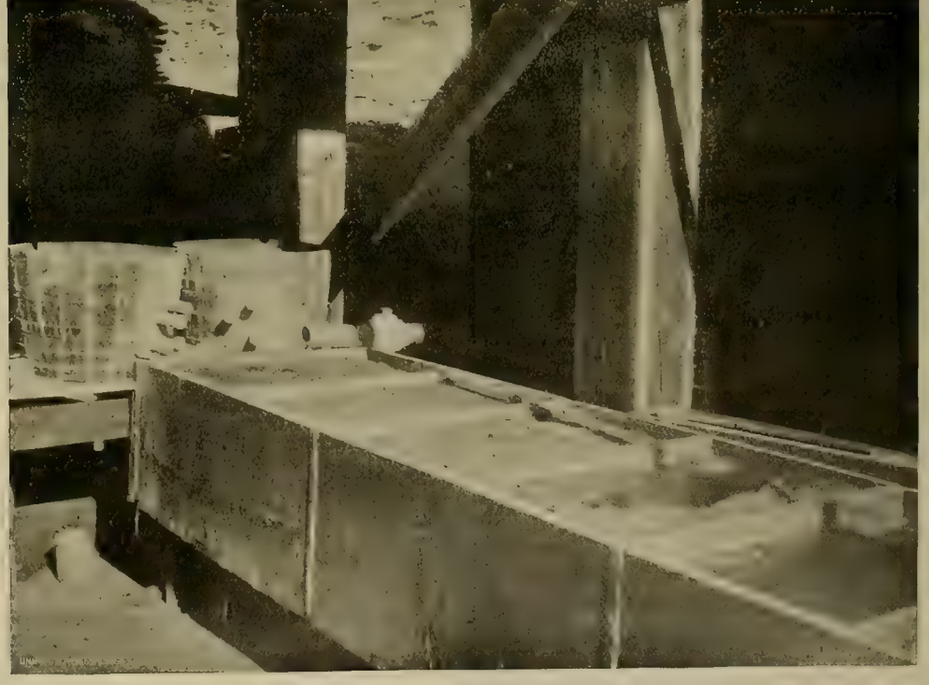

FIG. 6.—EXTRACTOR AT MOHEGAN MILL, MONTANA.

compartments of the extractor is such as to contract it, and in time, no matter how snugly it may fit when first put in, it will leave room for fluid to pass on all sides without passing through. At the same time the constant generation of hydrogen gas leaves bubbles under the zinc and it is lifted to the surface. That good work may continue, the extractor must have immediate attention. The surplus of hydrogen can be disposed of readily by stirring the zinc, but one cannot spread the zinc so it will fit the compartments without removing it and replacing it. All the zinc shavings, therefore, are taken from the compartments and carefully spread and packed in again once every twenty-four hours. If there are large matted rolls, they are shaken or pulled out and the zinc is made to fit evenly and snugly against the sides of the compartment, even to tucking it in. This obviates any tendency to polarization, gives assurance that no channels exist around the zinc, and also partially frees the zinc from any accumulated slimes. By this system as perfect a precipitation as anyone could ask has been secured from solutions carrying half a pound of cyanide to the ton, most of the assays of the sump solutions showing less than a weighable trace of gold in two assay tons. Under favorable conditions I have no doubt solutions of less strength could be handled successfully, but there is no object in making the attempt, for it is seldom one finds ores or tailings from which he would feel safe in attempting to dissolve the gold with less than this amount of cyanide.

(To be Continued.)

Methods of Testing and Sampling Placer Deposits.*

NUMBER II.—CONCLUDED.

By EDMUND B. KIRBY.

Sampling Gravel.—In practice, gravel for tests is conveniently washed either by the pan, the rocker, or by small sluices. In pan tests, at each point sampled, a number of pans of gravel are taken at uniform distances apart, down the exposed face of gravel. On account of the variations in the different layers, much judgment is necessary to do this properly. The bank may comprise stones of every size, and only the finer and richer material, filling the interstices between the larger stones, can be taken into the pan. The sample is therefore limited to material less than 3 or 4 inches in diameter. In most beds this pan size gravel ranges from 25% to 60% of the entire mass. This percentage should be estimated. It is not possible to calculate from it the value of this entire mass, because the larger stones are not barren. Much of the gold adheres to their surfaces, and fine gold seems to have a special tendency to do this. Hence, if a pan test shows 20 cents per cubic yard of fine material tested, and this represents only 50% of the mass, it is not correct to assume that the latter averages only 10 cents per yard. The test merely fixes an upper and a lower limit, and the real contents lie somewhere between the two; in this case between 10 and 20 cents.

Careful hand panning collects fine and scale gold perhaps more closely than any other practical method. It will be found best to wash down to the black sand, which is almost always barren, and then determine the gold by assay. One hundred and twenty pans are generally called a cubic yard, but the error of measurement in this way is very great. It is better to measure the sample in a small box made for the purpose. The swell of loose gravel above its original bulk in the bank is generally about one-fifth, so that 1 cubic yard in bank is equivalent to 1.20 cubic yards in the measuring box.

If the gold is not too fine, and many points are to be sampled, and a large quantity is to be handled from each point, it is better to wash in a rocker instead of in a pan.

On account of the difficulties mentioned, the only accurate tests are those in which the excavation of gravel is measured, and the sample taken is so large that it will include all workable sizes of stones standing in the bank. This requires the use of running water in a sluice. The latter may be 12 or 18 inches wide and, say, 36 to 48 feet long, with slat riffles arranged for easy removal. It is not necessary to use quicksilver unless the gold is very fine, and the quantity so small that a clean-up is difficult. The gravel from distant sample points may be hauled by wagon to the sluice. For gravel carrying fine gold, the writer has used an undercurrent attached to the sluice, but the additional saving has never exceeded 4½% of the total gold.

The following figures are taken from a certain case which is selected because it typifies a large class of the gravel deposits now remaining. It also illustrates the distribution of fine gold, and the comparative results of tests made by the methods above mentioned, and washing upon a large scale. The gravel was a heavy mass, with the gold so fine as to average only $\frac{1}{10}$ of a cent to a color. It was, therefore, very uniformly distributed through the mass. The tests were scattered over some 200 acres, and represent only the general mass of gravel, as the exposures had not developed any channel or other local concentration of coarse gold. The data from previous hydraulic washing, on 60,000 cubic yards, showed a recovery of 5.33 cents per cubic yard. Pan tests were made at some fifty points, each test including six to twenty pans. The face of gravel exposed at each point ranged from 6 to 30 feet in depth. A single test was as follows:

Vertical depth of gravel sampled	25.0	feet.
Number of pans taken	13	
Measured volume of sample, calculated to volume in bank	0.119	cubic yards.
Total gold saved (by assay)	1.145	cents.
Gold per cubic yard of sample	9.65	cents.
Estimated percentage of bank represented in sample	40.0	per cent.
Average contents of bank if large stones are barren	3.86	cents.

Actual average of bank lies between 9.65 and 3.86 cents.

Another series of tests was made by careful sluice washing with an undercurrent on quantities measured in place, and ranging from 30 to 80 cubic yards each. The face of gravel sampled in each case ranged from 25 to 35 feet deep. The results were as follows:

6.83	cents	per	cubic yard.
5.78	"	"	"
7.61	"	"	"
5.16	"	"	"
6.86	"	"	"

These tests were so distributed as to make the arithmetic mean of 6.45 cents a correct average. This figure represents the mass of gravel which had already yielded 5.33 cents by hydraulic washing. Hence, large scale work yielded 82.5% of the contents, as shown by small sluice tests. No doubt the difference is mainly accidental, because a few tests on such small quantities cannot check against the average contents of 60,000 cubic yards. The test sluice, however, had a slower current than the working sluice, and the undercurrent saved about 0.3 cent additional, so that a recovery somewhat higher was to be expected. A number of the pan tests were also taken from this particular ground, and these averaged 6.98 cents, as the upper limit, and 2.88 cents as the lower limit. This indicates, by calculation, that the large stones in the bank carried about 6.0 cents per yard, or almost as much gold as the pan size gravel.

Excavations may be measured by the usual method of cross sections. When a sample is cut down the face of a gravel bank, the writer has found it more convenient and accurate to use an artificial reference plane, made by stretching two wires from top to bottom of the bank. The cross-sections before and after excavation are measured from this plane.

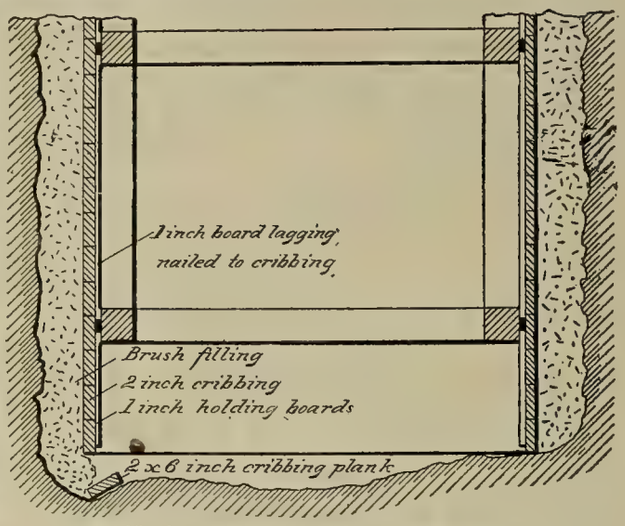
Notes on Test Workings in Water-Bearing Gravels.—Drop drill holes are valuable and generally necessary as a preliminary to the expensive work of shafts and drifts. They cannot, however, take the place of such work. Drill holes will furnish a cross-section profile of the bedrock, and thus indicate the most probable location of the channel. They will also show the presence of large stones and boulders in serious quantities, the existence of quicksand layers, etc. If gold is present, it will be brought up in the sand pump. A failure to find gold in the sand raised, may be evidence decisive enough to stop further operations, but the presence of gold, on the contrary, is not by any means decisive evidence. While drilling, the stones for a greater or less distance around the hole are churned and shaken. The finer and richer material in their interstices works loose, and flows into the bottom of the hole, so that the gold brought up by the sand pump is largely derived from this adjacent gravel. Hence, it is impossible to say what volume of gravel has yielded the gold recovered, and any figures of value per cubic yard, based upon drill hole results, is pure guesswork. Nothing could be more dangerous than to base a heavy investment upon such data.

The cost of drill holes in unknown gravel cannot be estimated closely. In favorable gravel, drilling is very rapid and cheap, but an abundance of large stones may make the work expensive, and cause the loss of many holes. The money thus spent, however, may accomplish its purpose in showing that the gravel bed is of such a character that it cannot be mined at a reasonable expense. Under average western conditions, the total contract cost of such work will generally range from $3 to $6 per foot of hole.

In these deposits there is no way to ascertain the structure of the pay gravel and its approximate contents, except by shafts and drifts. The depth of gravel does not usually exceed 40 to 70 feet, and much sand and small gravel must be raised with the water. A vertical centrifugal pump is therefore the best means of handling the flow. In one typical instance of quite open gravel, the flow reached a maximum of about 1800 gallons per minute, while sinking a 50-foot shaft. A few weeks of steady pumping, however, reduced this to 500 gallons. The extension of drifts increases the flow, but long continued draining has a remarkable effect in reducing it. A stream flowing over such a gravel bed seems to pack the interstices of its channel with fine silt, and it does not furnish water to the drained area as rapidly as might be expected.

Steam power will generally be found best, because of the temporary nature of the work, and the ease with which it may be moved from one shaft to another. Water power saves a serious daily expense, but requires a heavier first cost, and cannot be moved. It is also very difficult to adjust turbines to the increased power and speed required by the pump as the depth increases. The usual heavy cost of such work is almost invariably due to stoppages and breakdowns, and the most careful planning is necessary to reduce these to a minimum. The pump and stand pipe are best supported by an independent framework which can at any time be lifted out of the shaft. The pump shaft is driven by a quarter twist belt, governed by an idler pulley which will permit the shaft to be lowered 4 feet before shifting its pulley.

The two standard methods available for work of this kind are to sink by driving lagging, or to sink a caisson. With either method the shaft is apt to become distorted. Both are slow, and a caisson makes it very difficult to arrange the pumping plant. The method of driving lagging does not work well in coarse gravel, or where layers of large stones are present. Hence, in most cases, the following described plan, shown in the illustration, will be found best:



METHOD OF SHAFT SINKING IN WET GRAVEL.

The gravel along each wall of the shaft is excavated in the form of a small trench, and the space is packed with brush. A tilted cribbing plank, 2x6 inches, is used to hold the brush in place, and is finally forced into position so as to form a continuation of the outer cribbing. This is held temporarily by a few 1-inch boards, nailed on and braced, as required, until a depth of 4 feet is gained all around, and another set of regular shaft timbers can be placed. A lagging of 1-inch boards, extending between the two sets, is then nailed on the cribbing. A shaft was sunk in this way, by skilled workmen, 47 feet in twenty-nine shifts of ten hours each. The water flow was 500 to 800 gallons per minute, but no quicksand, and only a few large stones were encountered.

In drifting, it is necessary to use the standard methods, with driven lagging and breast boards. Two-inch lagging is generally used overhead and in the corners, and 1-inch boards at the sides and breast. This top lagging will often be found too light for the weight, and its bending causes delay and distortion of the work. In such cases, selected 3-inch lumber should be used.

In general, it may be said that, excluding stoppages, a shaft may be sunk at the rate of 1½ feet per ten-hour shift. Drifting should maintain an average of 1¾ feet per ten-hour shift. The main expense is due to stoppages, the cost of plant, and the cost of bringing in skilled workmen for a temporary job.

In work of this kind, the heavy water flow makes it almost impossible to take accurate measurements or samples. Most of the fine sand and gravel will pass out through the centrifugal pump, and may be put through the testing sluice. This, as well as the large stones, is apt to drop its gold on being loosened in the shaft bottom. The heavy water flow also washes out all fine gravel from the sides before it can be observed. It is therefore necessary to rely mainly upon panning and judgment during the progress of the work. After the ground has been drained for a while, it becomes possible to sample any special layers of the gravel.

THE increasing demand for aluminum as a substitute for copper in conducting electricity is a notable feature of the commercial situation. The Northwestern Elevated Road of Chicago has recently ordered 150,000 pounds of aluminum for feeders.

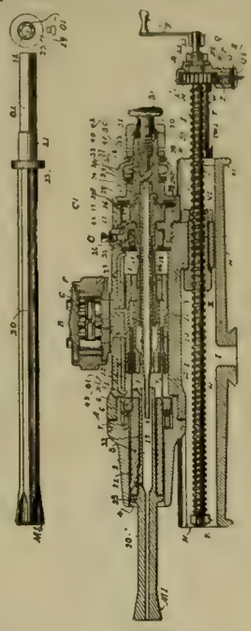
Latest Mining and Metallurgical Patents.

Patents Issued June 13, 1899.

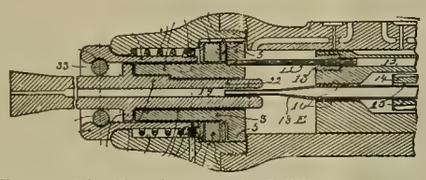
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ROCK DRILLING ENGINE.—No. 626,761; J. G. Leyner, Denver, Colo.



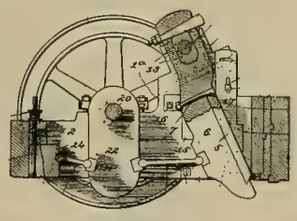
A rock drilling engine provided with a drill bit arranged to project into the cylinder of the drilling engine and arranged to be operatively struck upon its end by the reciprocal movements of the engine's piston and containing a passage or conduit from engine's cylinder to or adjacent to drill bit's cutting point and a water passage or tube or conduit and a suitable water supply through drilling engine to passage in drill bit whereby a commingled supply of the cylinder's actuating fluid and water is conveyed through said drill bits to their cutting points and to the bottom of holes while drilling them and the rock cuttings are thereby rejected.

DRILL HOLDING DEVICE FOR ROCK DRILLING ENGINES.—No. 626,762; J. G. Leyner, Denver, Colo.



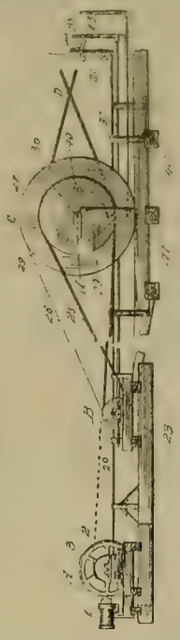
The combination in a rock drilling engine of the cylinder, the piston, the front cylinder head, with a water conveying tube projecting from the rear cylinder head with a drill holding sleeve, revolubly mounted in cylinder head; an axial bore through sleeve, a drill bit operatively supported by sleeve and arranged to be operatively rotated step by step by piston and sleeve, and having drill bit project into the reciprocal path of piston and arranged to be impinged by piston, a collet loosely mounted on sleeve, a spring arranged to hold collet in operative relation to sleeve and drill bit, an abutment on drill bit and a suitable pin or key removably secured in collet and arranged and adapted to be engaged by the abutment of drill bit, whereby drill bit is held in sleeve against accidental displacement.

ROCK OR ORE CRUSHER. — No. 626,955; G. W. Wright, Webb City, Mo.



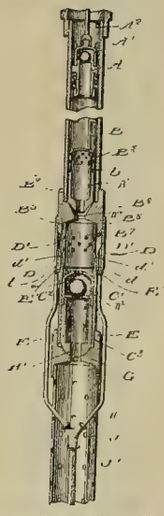
A rock or ore crusher comprising a crusher bed having a longitudinal compartment and inclined extensions, the adjustable boxes shiftable on the inclined extensions, the shaft mounted in the movable boxes, a bearing surrounding the shaft, a jaw bumper, keys extending through the bumper whereby the bearing is held in place on the shaft, an eccentric drive shaft, an eccentric bumper depending from the eccentric drive shaft, a toggle connecting the jaw bumper with the eccentric bumper, a wedge block, a toggle connecting the wedge block with the eccentric bumper, means for adjusting the wedge block, the side plates having forwardly and downwardly extending edges, and the outer reversible wear plates, and the adjustable intermediate wear plates having tenon-and-mortise connection.

APPARATUS FOR DRILLING WELLS.—No. 626,933; J. Reid, Oil City, Pa.



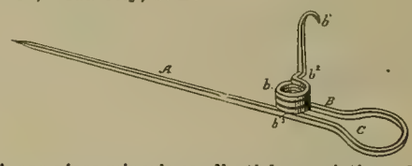
In combination with a well-drilling rig, a constantly running explosive engine, means whereby engine may be at will connected, disconnected or reversed in its connections with the drilling rig, a speed-controlling valve for regulating the admission of explosive material to the engine, whereby the speed of the engine may be regulated at will, a manually controlled and positively actuated lever and rod connection for controlling valve extending to the derrick floor, and means for controlling the connecting and reversing mechanism, also extending to points where they are simultaneously within reach of the operator. A drilling-rig shaft having independent pulleys and a brake wheel, a clutch shaft having loose pulleys and a clutch for connecting either of pulleys with the shaft, reverse connections between the clutch-shaft pulleys and the pulleys on the drilling-rig shaft, an explosive engine provided with a speed regulating valve and having driving connection with the clutch shaft and controlling levers connected respectively to the brake and the reversing clutch and to the speed regulating valve. The combination of the drilling-rig shaft 36 having the pulleys 27 and 29 and the brake wheel 40 provided with the brake band, the shaft 23 having independent pulleys 24, 25, loosely mounted thereon and respectively connected by straight belt 26 and cross belt 28 with the pulleys 27 and 29 on shaft 36, a constantly running explosive engine connected with the shaft 23, clutches whereby either of the pulleys 24, 25, may be made to rotate with the shaft 23, or both left loose thereon, and means whereby the brake band and the clutches are under control of the operator.

DEVICE FOR INCREASING FLOW IN OIL WELLS.—No. 626,949; J. R. Wheeler, Mannington, W. Va.



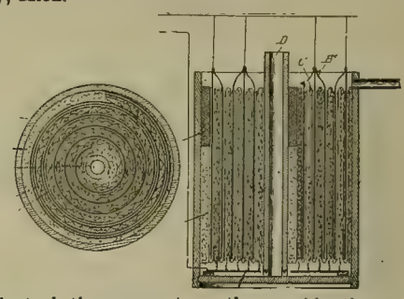
A device for clearing oil wells, the combination with the barrel and reciprocating valve therein, a cylindrical open ended strainer, a collar connecting the latter with the lower end of barrel, a communicating aperture between barrel and strainer, a union having connection with the lower end of strainer, and threaded connections with the union connecting the upper end of the strainer with barrel, a standing valve chamber connected to the lower end of strainer, a perforated barrel connected to the lower end of standing valve chamber, and communicating therewith, the external leader pipes having communication between the space D' about the circumference of said strainer B^7 and the interior of perforated barrel H, and the tube with which pipe connects and the jet pipe connected thereto and leading to the perforated barrel below. A device for clearing paraffine from oil-producing strata in oil wells, comprising in combination with the barrel B, the perforated tube B^7, the union D and connections between the latter and barrel B, the valve chamber within tube B^7, the perforated cylinder H and union connecting the latter with said valve chamber, the leader pipes communicating with ducts in the union D and passing through apertures in the wall of the perforated cylinder, the union connected to the lower ends of the leader pipes and the pipe J', the jet pipe K secured to the union connected to the leader pipes, the perforated cylinder N and union M connecting same with cylinder H, the open ended tube L' mounted in an aperture in the union M, the cylinder K^2 having connections with the jet pipe and open ended tube, and the plug R at the lower end of cylinder N.

MINER'S CANDLESTICK. — No. 626,817; A. W. Powell, Lead City, S. D.



A one piece miner's candlestick, consisting of the end pointed straight arm A, arm B bent to form socket b, hook b' and offset b^2, and the handle loop C, the said arm B being provided with a catch groove b^3.

ELECTROLYTIC APPARATUS FOR DEPOSITION OF METALS FROM SOLUTION.—No. 626,972; T. Craney, Bay City, Mich.



Electrolytic apparatus, the combination of an outer tank, an overflow pipe therefrom, an open-ended feed pipe centrally of the tank and extending above same, sheet electrodes separated by a porous medium coiled around pipe and forming in connection therewith a removable unit sealed within tank and an overflow pipe from top of tank. An electrolytic couple comprising an anode and a cathode, each composed of thin sheet metal or its equivalent, inclosed within folds of a cotton sheet or similar fabric, and a hollow core forming a central support upon which anode and cathode are jointly wound, core anode and cathode forming a removable unit of the apparatus conformable to the shape of tank and supported in position therein by walls of tank. The combination with tank of an anode and cathode composed of wire screen and lead foil respectively, each inclosed between cotton cloth with marginal projections extending oppositely therefrom and wound upon a hollow core into a tight roll conformable to interior of tank and sealed with tank. The combination of a series of electrolytic units, each composed of a tank, a hollow feed pipe centrally thereof, electrodes separated by a porous medium and filling in connection therewith interior space between feed pipes and tank, overflow pipes leading from one tank into feed pipe of next tank, and a supply pipe for electrolyte into one of the tanks, relative arrangement of tanks and their connection being such as to provide a continuous flow of electrolyte through all tanks of series.

Relative Cost of Mining.

TO THE EDITOR:—Referring to an editorial in the issue of the 10th inst., which concerns the cost of mining in the State of California, broaches a subject which receives too little treatment by technical writers and writers in general. This is a fact to be deplored, and the idea of the MINING AND SCIENTIFIC PRESS advocating a compilation of data dealing with costs of mining in different formations and under various conditions suggests itself to me as being commendable.

We have excellent and sufficient literature on the

cost of milling and milling processes; Rose's, Lewis' and Rickard's books serve their purpose, but if a mining engineer wishes to investigate the cost of mining a formation with which he is unfamiliar he has no literature on the subject, so his only reference is his notes. In developing and exploiting a new property, is not the cost of mining a more important question than the cost of milling? It is by far the less tangible to figure upon, unless actual mining is in progress. In milling, the extremes of cost per ton lie between small limits, whereas in mining the cost per ton may vary, even in the same district, from 30 cents to $10. In many cases, before exploration has begun it is necessary in determining the value of the property to make some calculation on the cost of mining, and the only guide an engineer has in doing this is his own experience. Is this not a good field to work in? SUBSCRIBER.

Washington, Cal., June 13th, '99.

The Lick School.

The California School of Mechanical Arts was founded by James Lick, who provided certain funds by deed of trust in 1875. Other funds to constitute an endowment were received at the end of a long litigation in 1895, the year in which the school actually opened. Its work thus far entitles it to attention, and interest in it is now doubled from the fact that the Wilmerding School of Industrial Arts is being erected upon an adjoining site and will open its doors to students during the coming year. The Wilmerding School is under the administration of the Regents of the State University. Though there can be no merging of one institution into the other, the two will divide the field of technical instruction, and thus complement each other and constitute a splendid agency for the advancement of industrial education.

CALIFORNIA SCHOOL OF MECHANICAL ARTS, FOUNDED BY JAMES LICK, SAN FRANCISCO, CAL.

The divisions of the field between the two institutions are interesting to mention. The curriculum of the Wilmerding School, already announced, will include a long list of building trades—carpentry, cabinet work, bricklaying, plastering, plumbing, stonecutting and architectural drawing. This will be a distinct benefit to the Lick School, which heretofore has been compelled to extend its efforts over a very wide field of instruction, in order to meet the average needs of a large clientage, representing all classes. Henceforth it will be the policy of the Lick School to expand along the line of the machine trades—pattern making, model making, forgework, molding, machine shop practice, electrical construction, etc.—leaving the field of the building trades to the Wilmerding School.

The engraving on this page gives a general view of the Lick School at San Francisco. There are two main buildings — the academic building and the shops. The former contains four recitation rooms, physical and chemical laboratories, drawing room, the modeling room and the domestic departments. Both are of stock brick, with trimmings of artificial stone. The shop building is made up of a two-story portion, a one-story portion, and an additional cupola shed built entirely of iron. A third building surrounds the brass furnaces, core oven and terra cotta kiln. This structure is of corrugated galvanized iron on wooden frame.

It is free of charge for tuition, and is open to any California boy or girl who has completed the eighth grade of the grammar schools, upon satisfactory recommendation from their former teachers, principals or school superintendent. Up to June 1st of each year places are reserved for qualified applicants. Applications received after June 1st are not acted upon until July 15th, and if the number of such applications exceeds the number of places remaining, then competitive examinations will be held for entrance. The expenses for books, tools, etc., average about $20 per year. During the last year 269 pupils were in attendance. A description of the school and its work is free to all who apply for it.

Diamond and Gold Mining in Minas Geraes, Brazil.

NUMBER II.

The third kind of diamond mining is from the "gupiaras," or deposits of gravel found on the slopes and sides of the valleys. The finding of these is largely a matter of chance. Some of them have proved wonderfully rich. From one, the "Gupiara da Lava-Pes," more than 160,000 carats were taken in one season. It covered an area of not more than six acres, and was probably the richest small deposit of diamonds ever found. Even this was not thoroughly worked over. Last year, two negroes doing a little casual washing on their own account one Sunday found twenty carats.

The fourth kind of mining is that in the conglomerates and beds of clayey rock which are found high up in the sierra. These beds are almost certainly the source of the alluvial diamonds, in just the same way that quartz veins are the source of placer gold. Contraband miners discovered that they were diamondiferous. These daring fellows, mining by stealth and in small parties in the little streams, followed them up to their sources. To their surprise, they continued to find diamonds clear up to the top of the sierra and finally in the country rock itself. The conglomerate or clay is, of course, far less rich than the alluvial gravel in which the gems have been concentrated by the action of water, but in compensation, the quantity is much greater. Much of it is hard and compact and difficult to work, but some is soft enough to wash away readily in running water. After the Brazilians had taken the diamonds out of the weathered surface, they proceeded to work the deeper deposits by the only method they knew:

They collected rain water in pools on the tops of the plateaus and led it by ditches to a favorable outcrop of the diamondiferous deposit, there cutting out great gullies in the soft rock. The action of the water separated the "formacao" from the bulk of the debris, and this was further treated in much the same way as the alluvial gravel. This method was slow and vexatious, because sufficient water for effectively washing away the masses of rock could only be collected a few days in each year. Ten working days is a good average for a twelvemonth, and whole seasons pass without a single day's washing. Nevertheless, fortunes have been made in this kind of mining, and some of these "chapada" mines, as they are called, have been continually worked for nearly a century.

A French corporation, the "Companhia de Boa Vista," has recently purchased a large tract of conglomerate-bearing plateau where mines already existed, worked as I have just described, eight miles from Diamantina, and has undertaken its exploitation on a large scale and by modern methods. A. Lavandeyra, an American citizen of Cuban birth, a graduate of the Troy Polytechnic School, and formerly one of the engineers of the Panama Canal, is the manager. Their conglomerate is found near the surface of the "chapada," or plateau, of Boa Vista at an elevation of 4300 feet above the sea. The installation now being completed consists of a reservoir on one of the higher levels of the plateau, the water from which is to be conducted by pipes wherever it is needed for washing. This reservoir is connected by a pipe 10 inches in diameter with another reservoir, half a mile away and 280 feet below the first. The latter is made by a dam across a small stream, which furnishes a constant supply of water sufficient for washing, but not large enough to run the pumps. These have a capacity of ninety liters a second and are operated by electric motors, which are connected by a wire running down the mountain side to a point 1040 feet lower. Here is the power station in the valley of a large stream, the Santa Maria. The dynamos are operated by a 500 H. P. Pelton wheel, and this in turn by a pipe 20 inches in diameter, a mile long, and with a fall of 340 feet. It is supplied from a dam built across a narrow gorge of the river. The machinery for separating the diamonds from the washed conglomerate is specially constructed and was built in Europe.

This is the first and, so far, the only noteworthy attempt to apply modern scientific methods to diamond mining in Brazil. The engineering and practical difficulties which Mr. Lavandeyra has successfully surmounted have been great. In engineering features, the plan is unique and original. The same conditions are to be encountered in no other kind of mining, and the methods of meeting them had to be thought out from the beginning. Even the diamond mining of South Africa affords no precedents. Skilled mechanics are unknown in the diamond district. Workmen have to be taught to use wheelbarrows or hammers and how to rivet pipes. There are no roads, and the miner must build his own. The difficulties of transporting heavy dynamos and castings on wooden-wheeled ox carts over mountain trails for more than 100 miles, are incredible. Ironworking, except horseshoeing, is unknown in that region, so repairs and changes are impossible to be made on the ground. The Boa Vista Company had the pipe cut in short sections and brought up on mule back. The native miners are very incredulous as to the success of the enterprise. They cannot understand how water can be carried in a little copper wire. Work was begun last March and is not yet finished. That the enterprise will be successful seems almost certain, unless the reasonable expectations of the company as to the amount of diamonds the conglomerates contain prove to be unfounded.

Should the Boa Vista mine be a success, it is sure to be followed by others, for there are many other diamond-bearing beds in the Diamantina district, and doubtless in the other districts as well. A large field for the sale of American machinery and for independent American enterprise would then be opened up. American miners are especially fitted for the work. The Boa Vista Company has, besides Mr. Lavandeyra, two American electricians engaged in the installation and operation of the electrical machinery.

Titles to diamond mines in Brazil are usually based upon discovery, registration, and the payment of a small fixed tax to the State. There is also a nominal requirement that a certain amount of work be done in the claim each year. Rights lapse upon failure to pay the tax or upon abandonment. Mining claims are very generally owned in the district. Nearly every man one meets has a claim which he is sure will make his fortune. The smaller miners roam almost at will over the country prospecting, and have the tacit encouragement of the owners. The latter, however, promptly assert their ownership if these are fortunate in making a good find, and unlucky enough not to be able to keep it secret. The owners get their claims prospected without expense.

The rough diamonds are usually sold by the small miners to buyers from Diamantina, who frequent the hamlets near the mines. Many are, however, brought directly to the city and sold to the general merchants. The prices of these rough diamonds vary largely with the fluctuations of the currency and with the quality and size of the stones and the necessities of the seller. Seventy milreis ($10) a carat is an approximate average. Practically all the stones which do not remain in Brazil are sent to Paris and London. Although the United States is the greatest diamond-consuming market in the world, taking about one-half of the South African product, very few Brazilian stones are imported directly. I am inclined to believe that a favorable opportunity exists for diamond buyers from the United States to enter this market, instead of competing for them in Europe. Besides, this would benefit the diamond-cutting industry in the States. Brazilian diamonds are worth, on an average, nearly 50% more than the Cape stones, being, as a rule, whiter. However, all colors are found, and the rose, wine colored, and blue varieties are much sought for and valued. From the appearance of a rough diamond, little can be told as to its luster and freedom from flaws after cutting.

(To be Continued.)

Personal.

ALFRED HANFORD has charge of the Folsom, Cal., dredge.

W. C. RALSTON has returned to San Francisco from the East.

J. C HADLEY is the new Supt. Gold Coin M. Co., Anaconda, Mont.

ROBT C. LUNDY of Ogden, Utah, is operating a mine at Idaho Springs, Colo.

JOS GRUSS has returned to Genessee, Cal., from an extended sojourn in Australia.

THOS. RICKARD, of the Parke & Lacy Co., San Francisco, is at present in Honolulu.

F. H. JOHNSON, of the Fulton Engineering and Shipbuilding Co. of San Francisco, is in Los Angeles, Cal.

MR. A. P. BRAYTON, SR., Pres Pelton Wheel Co., left San Francisco yesterday for a four months' trip to Europe.

E. H BENJAMIN, Sec'y California State Miners' Association, has returned to San Francisco from Plumas Co., Cal.

R. J. COLEMAN AND L. DUNHAM, of Denver, Colo., have been making examinations of mining property at Contact, Nevada.

H. F. BARTINE, Nevada's talented ex-Congressman, is now in charge of the mining department of the Anaconda, Montana, *Standard*.

P. H. CLINGAN of Florence, Colo., will superintend the construction of the new Golden Fleece mill at Lake City, that State.

M. BULKLEY, of the firm of Henshaw, Bulkley & Co., Fremont and Mission Sts, San Francisco, has returned from an Eastern business trip.

SAMUEL J. HENDY, Pres. and Gen. Mgr. Joshua Hendy Machine Works, San Francisco, has returned from a business trip through Colorado.

B. I. WHEELER, now of Cornell University, has been elected president of the University of California at Berkeley, Cal., at an annual salary of $10,000.

ROSS E. BROWNE, who recently returned to San Francisco from a professional visit to London, England, is inspecting the Jumper mine, Tuolumne Co., Cal.

A. W. MCCUNE of Salt Lake City, Utah, has a thirty-day option on the control of the Mono and April Fool No. 2, DeLamar, Nev., for which he agrees to pay $50,000.

LEE COCHRANE, Salt Lake City, Utah, representative Mine & Smelter Supply Co., Denver, Colo., is on a business trip through Idaho, Montana, Oregon and Washington.

H. L. BALDWIN has twenty men making a U. S. geological survey of the Uintah, Utah, forest reservation. He says miners will be allowed to cut necessary timbers therein.

WM. MORGAN, who has spent several years in the Yukon basin and other Alaska mining districts, has returned from the North and gone to southern California on a prospecting trip.

NOEL MONEY, connected with the London Exploration Co., and who has been equipping Siberian placer mines for that corporation, is making an inspection tour of California gold mines.

MARCUS DALY, who got $6,000,000 for his share of Anaconda, Montana, stock, will continue as manager for a year at a salary of $25,000 and then give up mining as a business for a while.

F. W. PECK, U. S. Commissioner-General to the Paris Exposition, is in Chicago and expects to visit Denver and San Francisco next month in the interests of the mining display at Paris next year.

MR. AXEL EKSTROM, representing the General Electric Co. of Schenectady, N. Y., who has been visiting in San Francisco, Cal., for some weeks, has left for Salt Lake City, Utah, and Denver, Colo.

A. G. SMITH, who for years was mill foreman of the Golden Star and Highland 120-stamp mills at Lead City, South Dakota, has gone to Bluefields, Nicaragua, where he will build and operate a stamp mill.

FRANK ROBB, who has been foreman of the Daly-West mill at Park City, Utah, for some time, has accepted a position as foreman of the Bellevue mill, near Baker City, Oregon. Mr. Robb has been succeeded by Mr. E. Buckley at the Daly-West.

R. H NORTON, former inspector of mines for the State of Washington, now representing the S. F. & S. J. Coal Co., is at McAdoo, Tenn., in consultation with Thos. A. Edison as to the feasibility of making the California coal into briquettes by electrical process.

W. L. FISK, Major U. S. Engineer Corps, has been transferred from Portland, Or., to Duluth. Capt. W. C. Langfitt has been relieved from temporary duty in the office of the Chief of Engineers, U. S. A., and takes station at Portland to relieve Major Fisk.

AT the third annual session in San Francisco of the Pacific Coast Electric Transmission Society, on the 20th and 21st inst., A. Poniatowski of San Francisco was elected Pres., A. G. Lamson of Salt Lake City, Utah, Vice-Pres., and Wm. Angus of San Francisco Treas.

PROF. F. W. MCNAIR has been unanimously elected president of the Michigan College of Mines at Houghton, Mich. The board of control and the friends of the institution express great confidence in his ability to maintain the college in the front rank of monotechnic schools.

Recently Declared Mining Dividends.

Isabella, Cripple Creek, Colo., dividend 2 cents per share, $45,000; payable June 26.

Gwin Mine Development Co., Calaveras Co., Cal., dividend No. 7, 25 cents per share, $5000; payable June 15. Total to date $35,000. At a recent meeting of the stockholders the capital stock was increased from 20,000 to 100,000 shares.

Ætna quicksilver mine, Napa Co., Cal., quarterly dividend, 10 cents per share; payable July 1.

Napa Con. quicksilver, Napa Co., Cal., regular quarterly dividend 10 cents per share, extra 10 cents; payable July 1.

New Idria, quicksilver, San Benito Co., Cal., regular quarterly dividend, 10 cents per share, extra 10 cents per share; payable July 1.

El Dorado M. Co., El Dorado Co., Cal., dividend 10 cents per share; payable July 20.

American Zinc, Lead & Smelter Co., dividend No. 1, $20,000; payable July 1.

Argonaut mine, Amador Co., Cal., $20,000; payable June 26.

Gold Coin mine, Colorado, $10,000; payable June 26.

Modoc mine, Colorado, $10,000; June 24.

St. Joseph Lead M. Co. of St. Louis, Mo., $37,500; May 25; total, $2,359,500.

Homestake M. Co., South Dakota, regular monthly dividend, 25 cents per share, $62,500, extra 25 cents per share, $62,500; payable June 26.

Industrial Notes.

—Coalinga, Cal., is shipping increased quantities of oil.

—At Atlin, Alaska, are reported 2000 idle, disappointed men.

—California soil is found favorable to the growth of cork oak.

—Pennsylvania coal miners will increase the Tesla, Cal., coal output to 800 tons daily.

—At Stockton, Cal., last Saturday, a machine cut, threshed and sacked 1600 sacks of barley.

—The Sierra Railway Co. proposes to build a branch of its line from Jamestown to Angels, Cal.

—United States government engineers do not favor the project of a boat railway at The Dalles, on the Columbia river, Oregon.

—P. P. Shelby, Gen. Mgr. Pacific & Idaho Northern Railway, is laying a mile of track a day from Weiser, Idaho, into the Seven Devils country.

—The plant of the U. S. Smokeless Powder Co., at San Rafael, Cal., was totally destroyed last Saturday by an explosion in which five men lost their lives.

—The Florence & Cripple Creek, Colo., Railroad proposes to build a spur to Canyon City, Colo. The Moffatt people talk of erecting a smelter and refinery at that point.

—For the ten months ending April 30th, '99, the gross earnings of the Oregon Short Line Railroad were $6,175,912 37, an increase of $1,014,469.85 over the same ten months of '98.

—The Brice Syndicate exhibits renewed interest in the Chinese railroad concession recently referred to at considerable length, and construction of the road will probably begin in 1900.

—The stern-wheel steamer Hassalo, on the Columbia river, Oregon, has a speed of twenty-six miles per hour. She is 186 feet long, has a tubed boiler 8 feet diameter, and 3000 H. P. compound engines.

—The Wyoming Southern Railroad has incorporated at Cheyenne, Wyoming, to build a line from Fort Steel to Grand Encampment, seventy miles, where copper and gold exist in paying quantities.

—"Chunks of virgin gold" are the latest discoveries on the Yukon, Alaska—made by newspaper correspondents and the agents of transportation companies, who lure believers in such stories to hardship and death in Arctic wilds.

—The president of the Mexican Central Railway estimates that Mexico will probably produce $12,000,000 worth of gold this year, and predicts that when the richer mines are reached by railways Mexico's gold production will rise to $25,000,000 or $30,000,000 annually.

—A. G. Wilber of Boston, who is interested in mining enterprises in the State of Jalisco, Mexico, reports large recent investments of American capital in mines in the western part of Jalisco and much mining machinery going in over the Mexican Central's western extension. English capitalists have representatives there looking for copper.

—An agreement has been reached between the Colorado Midland and Busk Tunnel bondholders. The Tunnel bonds, aggregating $1,250,000, are to be exchanged for Colorado Midland 2-3 4s, bond for bond. The Tunnel bondholders are also to receive in cash 4% interest, less legal expenses, for the period of the receivership estimated at $140 to $150 per bond. This latter payment is in settlement of the judgment for $176,000 obtained by the Tunnel Co. against the Midland for rental. The money has been held by the Trust Co. pending negotiations, and under the settlement just reached about $91,000, representing 4% interest, goes to the Tunnel bondholders, and the remaining $85,000 will be returned to the Midland treasury.

Obituary.

E. C. UREN, an old and respected resident of Placer Co., Cal., and a pioneer miner in that section, died at Auburn, Cal., on the 14th inst., in the 73rd year of his age.

N. A. CONE, one of the best-known mine operators in Colorado, and manager of what were known as the Smith-Moffatt interests in Cripple Creek, died on the 16th inst. in Denver.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING JUNE 3, 1899

626,882 —FLUSHING TANK—E. B. Badlam, S. F.
626,922 —HANGER FOR GRINDSTONES—F. M. Bird, Wenatchee, Wash.
626,805 —RATE CABINET AND INDEXER—F. E. Coates, Montpelier Cal
626,966 —WEED PULLER—J. Conzett, Ferndale, Cal.
626,958 —CIGAR HOLDER—H. H. Coote, Bisbee, Ariz.
626,753 —PORTABLE BOOTH—J. W. Ernest, Los Angeles, Cal
626,682 —GATE—A Field, Portland, Or.
627,076 —MAGAZINE BINDER—G. S Glover, S. F.
626,807 —GYRATING PENDULUM—F. Gundorph, S. F.
627,061 —SMOKE CONSUMER—A. Herberer, Alameda, Cal
626,809 —TELEPHONE REGISTER—Hock & Happersberger, S. F.
627,081 —COPYING PRESS—B. Phelps, Seattle, Wash
627,082 —BENCH STOP—B Phelps, Seattle, Wash.
626,777 —FISHING HOOK—H. Slotterbeck, Los Angeles, Cal.
627,025 —CAR THERMOMETER—W. Turner, Wenachee, Wash.
626,801 —VEHICLE ATTACHMENT—S. Wyatt, S. F.
627,037 —BURGLAR ALARM—Wybro & Danley, S. F.
32,005 —DESIGN, WRENCH—C. W. Cookson, Wilmington, Cal.
31,003 —DESIGN, SNAP HOOK—W. P. Murphy, San Jose, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

VEHICLE ATTACHMENT AND HOLDING DEVICES.—Samuel Wyatt, San Francisco, Cal. No. 626,801. Dated June 13, 1899. This invention relates to a device which is designed to hold the reins when a team is to be left, also to carry a lantern if desired at night. It consists of vertical standards having slots in the upper end for the attachment of the reins, and a means connected with the wheel hubs by which the shafts may be rotated if the vehicle is started, and thus wind up the reins and exert a sufficient pull to stop the horses. The upper end of the device may be provided with a suitable standard to receive a lantern or other appurtenance of the vehicle.

COIN-CONTROLLED TELEPHONE REGISTER.—T. S. Hock and E. Happersberger, San Francisco, Cal. No. 626,809. Dated June 13, 1899. This invention is intended to register the number of coins which are placed in a telephone or other apparatus of this description, and at the same time to indicate that a coin has been placed in the slot and registered for the purposes of communication. It comprises a series of registering disks, a pawl-carrying lever fulcrumed so that by its forward and backward movement it advances the disks to register the movements. A pawl and ratchet mechanism prevents the lever from returning until the forward motion is completed, and a latching lever retains the operating lever in its normal position when it has been returned thereto. The latching lever is disengaged when a coin is introduced into the apparatus. An electrical current is closed by a guard plate carried by the lever so that when the forward movement has been completed the central office will be notified of the fact and the registration will be completed.

RATE CABINET AND INDEXER.—F. E. Coates, Montpelier, Cal. No. 626,805. Dated June 13, 1899. This invention is designed to exhibit rate sheets, such as are used in railway offices for the purpose of giving freight, passenger or other rates between different stations, and other like purposes. These rate sheets are arranged alphabetically or otherwise so that the station agent may by examining them inform himself as the rates between various stations. In this invention these rate sheets are alphabetically arranged and the apparatus employed therewith is designed to throw up any sheet for inspection. It consists of a containing case with vertically guided counterbalanced tables containing the sheets, latches by which the tables are normally retained in the lower part of the case, disengaging devices connected with each of the tablets, consisting of correspondingly lettered or numbered depressible keys, connection between the shanks of the keys and the latches whereby the depression of a key disengages the corresponding catch and permits the tablet to be exposed for inspection. In connection with this are means for again depressing the tablets to their normal position after the necessity for their use has passed:

FLUSHING TANK FOR CLOSETS.—E. B. Badlam, San Francisco, Cal. No. 626,882. Dated June 13, 1899. This invention relates to an improvement in tanks connected with apparatus where it is desired to periodically discharge a definite body of water for the purpose of flushing the apparatus. It consists essentially of a siphon pipe having one end connecting with a discharge and the other terminating interior to the tank and near the bottom. Holes are made upon and above the bottom of the pipe, a cylinder having open connection with a jet nozzle which stands within the interior lug of the siphon, and a plunger is freely movable within the cylinder having connections by which it may be forced down to charge and start the siphon, a counterbalance weight of less power than the suction produced by the siphon retains the plunger at the bottom of the cylinder until the water in the tank is low enough to expose the openings above the bottom of the siphon leg, when the siphon will be broken and the tank will be allowed to refill the apparatus, thus working automatically after it has been started by the movement of the piston within the cylinder.

TREE AND VINE PULLER.—E. P. Boden, Santa Clara, Cal. Reissue 11,474. Dated June 13, 1899. The object of this invention is to provide an apparatus by which the stumps of all small trees, vines, bushes, etc., may be removed with ease and rapidity. It consists essentially of a frame mounted upon wheels adapted to be moved over the ground, a truck or traveler movable longitudinally upon the frame having means connecting it with the stump and means whereby an upward pull from the traveler is applied to lift the pump when the main frame is moved longitudinally along the ground with relation to the traveler and the stump.

Commercial Paragraphs.

THE Weber Gas & Gasoline Engine Co., Kansas City, Mo., has issued a booklet of facsimile testimonials from mining men who have used Weber hoists.

MR. O. G. SMITH is the Colorado representative of the Stillwell-Bierce & Smith-Vaile Co. of Dayton, O., with offices at 731 Seventeenth street, Denver, Colo.

BEGINNING July 1st, F. C. C. Scherling assumes the proprietorship of the West Coast Wire & Iron Works, with office and headquarters at 9 Fremont St., San Francisco.

THE Fortune Exploration Co., of which H. A. Clapp of Colorado is manager, have just shipped a carload of machinery to the southern part of Sonora, Mexico, to be installed in placer work.

THE Joshua Hendy Machine Works, San Francisco, Cal., has closed a contract with the Smuggler-Union M. Co., at Telluride, Colo., for thirty-two 5-foot Triumph concentrators, and has an order for the Carribeau M. Co. for four 5-foot Triumph concentrators.

AT Pocatello, Idaho, is a 130,000-pound steam shovel, the scoop having a capacity of three cubic yards of gravel. It was built by the Bucyrus Co., South Milwaukee, Wis., for the Oregon Short Line. The huge machine is finely adjusted and is doing effective work.

ON July 1st the California Wire Works, A. S. Hallidie proprietor, will remove from the present location, 330 Market St., San Francisco, to the old headquarters of the company 9 Fremont St., San Francisco, which were occupied by Mr. Hallidie and his associates for so many years.

At the new chlorination works building at Florence, Colo., twelve Wilfley tables are installed on the double-deck plan. The Mine & Smelter Supply Co. of Denver, Colo., last week got an order for ten more Wilfley concentrators for the Anaconda M. Co., making eighty-nine Wilfleys in Butte, Montana.

JNO. TAYLOR & CO, San Francisco, Cal., have issued a finely illustrated catalogue and price list of chemicals, assayers' supplies and apparatus that is worthy of that old established firm. Everything that the assayer or chemist ordinarily needs or uses is mentioned and illustrated in its 234 pages, which besides contain information of much practical value.

THE firm of Henshaw, Bulkley & Co., Fremont and Mission Sts., San Francisco, will in future have charge of the California and Hawaiian Islands interests of E. P. Allis Co., Milwaukee, Wis. The branch office at 9 Fremont St., San Francisco, which has been under the supervision of Mr. N. A. Root, will be moved to the establishment of Henshaw, Bulkley & Co., July 1st, Mr. Root continuing in charge of that department.

THE most recent catalogue issues of the Westinghouse Electric and Mfg. Co., Pittsburg, Pa, are Nos. 222, 223, 225, 226 and 228, treating of direct connected railway generators, lightning arresters, A. C. fan motors, D. C. fan motors, and polyphase motors, respectively. The Westinghouse Electric & Mfg. Co. have a contract to supply a large electrical equipment, consisting of two generators of 1000 H. P. each, and two exciters of 460 H. P. each, with a travelling crane, to be erected in the power house for handling the machinery of the Hartford Electric Light Co. on the Farmington river, near Tariffville, Conn., and a power station will be constructed containing the necessary turbines, governors, feeder, waste gates and racks. The plant calls for a concrete dam about 35 feet high, with a power station of concrete, steel and brick.

Recent Mining Incorporations.

Mammoth Copper M. Co., Sacramento, Cal.; capital stock $200,000, subscribed $20,250; C. E. Waite, D. M. Cooper, G. Faig, J. M. Crabbe, J. B. Atwood.

Northwest M. Co., San Francisco; capital stock, $500,000; B. Henley, C. A. Macomber, E. R. Stevens, M. F. Macomber, D. W. McNeil, T. K. Statler.

California G. M. & D. Co., San Francisco; capital stock, $1,000,000; B. Morgan, F. Egon, J. F. Myers, A. C. Zeig, A. A. Quellmalz.

Stephens Process Co., Los Angeles; capital stock, $1,000,000; A. G. Stephens, A. F. Levitt, I. S. Smith, B. Grimes.

Black Oak South Extension M. Co., San Francisco; capital stock $100,000, subscribed $500; W. E. Miles, R. S. Moore, D. J. Staples, J. J. Mason.

Illinois & Josephine Gravel M. Co., San Francisco; capital stock $100,000, subscribed, $125; B. F. Gilman, J. J. Scrivner, H. A. Griffin, D. B. Richards, J. C. Sullivan.

Mining Summary.

ALASKA.

(Special Correspondence). — The veins of Ketchikan district are in metamorphic rocks traversed by dykes of diorite and range in size from 2 to 7 feet. At the surface they show the characteristic gossan of iron-copper bearing veins. Several shafts have been sunk 40 to 60 feet, showing carbonate of copper ores and at the greater depths sulphides of copper and iron. The ores also contain gold. A tunnel has been driven 122 feet on the Prince of Wales vein under the direction of Mr. Lichstadster, Mgr. for a German syndicate. At the Sea Level camp below Kitchikan on Gravina island, fifteen men are employed at the Six-Point mine, R. L. Dunn, Mgr. No machinery has yet been placed on any of the mines, all work being in the nature of prospecting. The hills are not abrupt, and are covered with abundance of timber. The surface is covered with moss to the depth of 2 feet, more or less though some areas are bare. The prospectors search for veins by walking along the surface and thrusting a steel rod with a sharp point down through the moss to the rock surface beneath, the quartz being detected by its gritty feeling when struck by the point of the rod.

Ketchikan, May 15th, '99.

The Alaska Mexican mine for the thirty days ending June 9 reports 13,826 tons ore reduced with 120 stamps, value $21,546, and 270 tons sulphurets, value $10,820; total for the month, $32,366; the ore averaged $2.70 per ton. The month's expenses were $26,456.

The Alaska-United mine for the thirty-five days ending June 7, with 220 stamps, crushed 31,177 tons ore, value $34,480, and 517 tons sulphurets, value $19,530. The ore averaged $1.87 per ton.

ARIZONA.

The output of copper mines of Arizona has increased the past three months materially under the stimulus of high prices.

Needles *Eye*: R. J. Dyas of St. Louis, Mo., has taken the Gier Basin property, four miles below Bill Williams Fork, near the Colorado river, and will increase the force of men at work. T. R. Owen is in charge. Air compressors, drills and modern appliances will be used, it being the intention to sink 1000 feet. A smelter is but a question of time.

Prescott *Courier*: E. P. Holliday has struck $100 ore in the Gold Leaf mine, Hassayampa district, ten miles south of Prescott. J. Dougherty and J. I. Gardner are interested in this property.

Prescott *Journal-Miner*: W. H. Ferguson has shipped the second carload of ore from the Grand Canyon mine. He expects to ship two carloads per month.——The Bullion G. M. Co. are developing the Bordeaux mine. The shaft has been drained and is being retimbered. A tunnel is being driven and at 80 feet shows 5 feet of ore. —— A 20-ton cyanide plant has just been completed at Placerita near Antelope hill for Burkdall & Mahart. It will be used in treating tailings from the 10-stamp mill there.

Tucson *Star*: More mines have changed hands in Pima county during the last six months than during the ten years previous. ——F. Kuhne reports 2 to 3 feet of sulphide ore in the bottom of a 70-foot shaft on the Mark Twain, on Lynx creek, owned by himself and F. M. Murphy. Values run in gold, silver and lead.——Surveyor P. Contzen, with S. Brown has gone to the Grand Reef mine, in Graham county, for J. W. Mackay, who is developing that property. The workings of the Grand Reef are down over 500 feet.

Globe *Times*: Four miles north of Rye the gold properties on Tonto, owned by J. C. Mankins, have been worked by steam arrastra the past winter. The want of water is a drawback, but water can be developed. Six hundred and fifty feet of work has been done. North of these claims two and a half miles Voegel & Craig are operating a stamp mill, mostly on custom ore.

Kingman *Miner*: W. R. Askew has bonded Koshland & Co.'s half interest in the Greenwood mine, near Signal, and has put twenty men at work. The company recently purchased the other half of A. Grant. The Greenwood mine is a large vein of low grade gold ore. In early days a 10-stamp mill was put up on the Sandy six miles from the mine. The mill made but two runs.

CALIFORNIA.

Alameda.

The output of the Tesla coal mines is to be increased. Supt. R. H. Norton has employed forty experienced Eastern coal miners to work the mines according to Eastern methods. An effort will also be made to compress the fine screenings into coal briquettes.

Amador.

Amador *Ledger*: The Oneida shaft has reached the 1900-foot mark, and very close to that point the ledge was passed through. The ledge is 12 feet thick at the south end of the shaft and 10 feet at the north end; is good milling ore.

Amador *Republican*: The South Eureka mine, north of the Oneida, keeps a 20-stamp mill busy. Preparations are being made to sink the shaft deeper. The shaft is down 1600 feet. Sixty men are employed.——At the Ranlett copper mine the steam power has been doubled by putting in a large new boiler. A smelter has been brought to the mine and will be set up. The mine has been pumped out and ore is being hoisted. Twenty-two men are employed and the force will be raised to fifty.

Sutter Creek *Record*: Another strike is reported from the Shenandoah mine on the Easton claim, near Plymouth.——Supt. S. R. Porter of the Baliol mine at Sutter Creek, on behalf of himself and others, has purchased the Fernando ranch of sixty acres. It is mineral land. Several veins are in sight on the property. The company will be incorporated under the name of the Mutual Mining Co.——Supt. J. R. Tregloan is doing some retimbering in the 1400-foot shaft at the South Spring Hill mine and will commence taking out water. ——Supt. Porter was below last week and purchased for the Baliol mine a diamond drill capable of boring 1500 feet. It is the intention to drill east and west from the 300 level. There is a 40-foot vein uncovered in the mine and the mill is running steadily. Sinking is to be resumed at once.——Supt. W. R. Thomas reports the Central Eureka shaft down nearly 1400 feet. A contract has been let for running 500 feet of tunnel north on the 1350 level. Sinking will be continued and a new level will be opened at the 1600 level.

Calaveras.

The main shaft of the Melones Con., near Robinson's Ferry, is down to the 600 level. W. C. Ralston, Mgr., has returned from Boston, Mass. It is thought that the normal capacity of the 120-stamp mill now building will be 600 tons daily. The cost of mining and milling is estimated at $1.74 per ton.

At the regular meeting of the Gwin Mine Development Co., held in San Francisco, Cal., on the 15th inst., the capital stock of the company was increased from 20,000 shares to 100,000 shares. There was no increase in capitalization. The regular monthly dividend was declared, payable June 15th.

The Melones Con. M. Co. has purchased the mine owned by G. W. Cordes at Robinsons Ferry.

Twenty-five men are employed at the Bruner mine near Albany Flat.

It is reported that a rich strike has been made in the Lampbear mine on Spring Gulch, near Mokelumne Hill. The strike was made in the 300 level. The vein is 10 feet in width and the gold distributed throughout the rock.

Amador *Republican*: The Big Bar mine, owned and operated by S. H. Lucas and G. G. Gates, is situated on the south bank of the Mokelumne river, opposite the Blue Lakes power plant. It is in a grano-diorite area, between amphibolite schists on the west and slates of the Calaveras formation on the east. The working tunnel has been run into the hill 1000 feet. The ledge is 7 feet thick. The quartz is free from any admixture of country rock, is white and not hard. Mr. Lucas states that the ore being milled goes $4.50 per ton and can be mined and milled for $1 per ton. The mill contains ten stamps. Mr. Lucas has planned to build a 20-stamp mill on the south side of the river near the mine, and use the present mill building as a power-house in which to produce air pressure for the mill and mine.——Good ore has been struck in the north level of the Esperanza mine at a depth of 1000 feet. The ore carries free gold and galena. The vein has developed from a small stringer to 2 feet. They are preparing for the new hoist, additions to the mill and other improvements.——Operations have commenced on the Vorlander mine, near the Middle Bar bridge on the Mokelumne river, under the superintendence of C. M. Burleson. As soon as the hoist is completed sinking a shaft on the lead will begin.——A. Pellaton & Co., owners of the Shoestring gravel mine on the Calaveras river, have men at work. A tunnel was driven in on the mine some years ago, at the end of which a winze was sunk 45 feet to the channel. There is an upper and lower channel in the mine. The owners will work the lower channel only by drifting.

El Dorado.

Placerville *Republican*: A mining company has been organized in Placerville, with local capital, to prospect the Tipton Hill mine deep gravel deposit, to be worked by drifting. G. W. Kimble is Supt. and T. Swansborough foreman. Ten men will be employed. The property is bonded by Mrs. F. Irish.

Georgetown *Gazette*: It is reported that work is to be resumed on the Two Channel mine at Kentucky Flat.——Operations on the Ida Livingston mine in Kelsey district have been resumed, with J. Kelley as Supt.——In the work of unwatering the Darling mine, the 115-foot mark has been passed and sinking will be commenced. Ten men are employed.——McGraw & Roberts have struck good prospects on their claim in Kelsey district. They are having a crushing of fifty tons made at the Ranney & Smith mill. It is said to mill $8 to the ton.

Inyo.

The cyanide process is to be tried on the tailings at the Weaver mill.

The P. D. Q. Cyanide Co. extracted $8 per ton from tailings at the Montgomery mill in Pleasant canyon.

A rotary mill is to be built at the World Beater mine, near the head of Pleasant canyon.

Kern.

A strike of 8 feet of free milling ore is reported in the Stringer district, near Randsburg. The ore will be crushed at the Red Dog mill.

The Garfield mine is working, the ore going to the Black Hawk mill.

Bakersfield *Californian*: C. Koehn has begun milling 350 tons of ore from the Winnie dump at Randsburg and what he takes out of the mine at the Black Hawk mill.——D. A. Clements of Colorado Springs, Colo., is at Randsburg. He has made two trips to the Rademacher district.

Randsburg *Miner*: The Annex mine is showing up well. It is owned by Montgomery & Maginnis. A milling made recently at the Red Dog mill turned out well. The shaft is down 130 feet.

Nevada.

G. L. Loope and associates of Beasmer, Michigan, have bought the St. Patrick group of mines in Washington district from W. D. Pinkston of Auburn for $100,000, and will incorporate a company to be known as the Paris G. M. Co. They will build a 20-stamp mill. Mr. Pinkston retains a small interest in the property, and will be Gen. Mgr. This is a large low-grade mine.

A. Pugh is prospecting the Giant King mine. Two shifts are driving the tunnel on the ledge.

In a report to the directors of the Brunswick Con. M. Co. of Grass Valley, R. G. Brown, Mgr. of the Standard Con. M. Co. of Bodie, advised as follows: "Stop the mill; provide funds for the necessary shaft work, and then start up with a good shaft, full pumping and hoisting facilities and with ore ready to stope." Supt. Mallen believes he can hoist ore in the present shaft and meet the floating debt of the company. No change has yet been made in the method of working.

Nevada City *Herald*: The incline shaft at the Reward mine near Nevada City is to be sunk 300 feet deeper, and an assessment of 2½ cents per share has been levied on the capital stock of the company for that purpose.

Placer.

The Lost Camp mine at Blue Canyon has been closed down owing to shortage of water.

Auburn *Herald*: The Polar Star mine at Dutch Flat, owned and operated by W. Nicholls, Jr., has given employment to thirty men during the past season. From reports the mine has done well and preparations are being made for next season.——The Blue Lead M. Co. will erect a 10-stamp mill on their mine. S. L. Jordan is Supt.——The Gold Run Gravel M. Co., Limited, is running a mill. The gravel prospects well. The company's hydraulic mines will have water a few weeks longer. ——The Mayflower mine near Forest Hill has closed down.——A San Francisco company has leased R. Greenwood's mine at Bath and are preparing to prospect the ledge.——H. Davis has completed preparations for the summer's work at Mammoth Bar.——Julien, Reynolds & Co. are prospecting the bar on the Middle Fork at Long Canyon crossing. The company have machinery, pumps, etc., and expect to reach bedrock in a short time. The bar showed prospects in the preliminary work last year.——Paul Carrrero, who has been operating at Turkey Hill for a year, has located a claim on Middle Fork above the claim of Julien, Reynolds & Co.——M. Savage of Bald Mountain is prospecting on the Middle Fork, below Duncan Canyon.

Auburn *Republican-Argus*: At the Marguerite mine near Auburn drifting on the 500 level is in progress. Twelve men are employed.——The shaft at the Whisky Hill copper mine is down 135 feet. Cuts have opened up 1200 feet of the ledge. The rock yields 9% copper, $3 in silver and $5 per ton in gold.——J. McAninch, G. Cowan, E. B. Quigley and J. Shiels have bonded the Glen Consolidated mine in Duncan canyon to a Colorado company.

Plumas.

Quincy *National-Bulletin*: A group of claims two miles south of Clairville, on the Middle Fork of Feather river, is owned by L. F. White. The vein strikes northwest, and where exposed in a cut is 35 feet wide. It occurs at or near the contact of granite and slate. The footwall of the vein is exposed to a depth of 20 feet. Adjoining this on the west is porphyry, white and much decomposed, though lying to the west of this again are veins or stringers of quartz, heavily mineralized. The decomposed porphyry is said to carry gold. The quartz carries both gold and silver. One assay made in San Francisco returned 1 80 ounces in gold, and sixty pounds milled by Mr. Redstreake, at the Jamison mine, yielded $21.20 per ton.

Plumas *National-Bulletin*: Work on the Four Hills property will be carried on this season; 4800 feet of 12-inch iron pipe is arriving at Clairville and shipped by team from that point. This will convey water to a 200 H. P. electric plant to be located a mile and a half from the mine. Electricity will furnish power for operating an air compressor, with which the hoisting is to be done. Two Pelton wheels will be used under 900-foot head. The hoist will be 80 H. P. Electric power also will be used at the 10-stamp mill now on the mine. The mill is supplied with the new Gates crusher.

Riverside.

(Special Correspondence). — The Gavilan mines are on the San Jacinto Estate, seven miles west of Perris. The veins were worked years ago by Mexicans, who hauled the quartz to numerous arrastras in the neighboring gulches. The property was re-opened in 1892 by Riverside people but again closed down. More recently a second and more successful attempt has been made under the direction of H. B. Varcoe. The main shaft is down 250 feet and rich ore is being taken out. A 10-stamp mill is being run on the ore. The formation is granite cut by numerous veins of pegmatite. In this district some of the quartz containing black tourmaline carries gold. The veins dip to the westward, usually about 30°.

Perris, June 18th, '99.

In the Eagle Mountain district, thirty miles northeast of Walter Station on the Southern Pacific railroad, Adams & Pickering are running a 2-stamp mill on the Korn Springs mine.

At the Iron Chief a new vein has been discovered.

At the Gold Canyon mine, north of Salton, which was formerly owned by Mr. Fish of Banning, five stamps are running.

Santa Barbara.

The Sunset Oil Co. has been formed for the purpose of operating in the Summerland oil field. It has a paid-up capital of $50,000. The directors are J. C. Hassinger, F. A. Conant, H. W. Moore, S. W. Knapp and E. P. Stevens, each holding $10,000 worth of stock. The company has bought the Clark-Stevens interests and other property in Summerland, and will begin development in the beach section of that district. They already own sixteen producing wells.

Shasta.

The new scale of wages of the Mountain Copper Co. at Keswick is as follows: Yard men, 25 cents; matte and pot-pullers, 30 cents; tappers, 40 cents; skimmers, 50 cents; charge wheelers, 30 cents; feeders, 40 cents; firemen on reverberatory, 50 cents.

Redding *Searchlight*: A. J. Cook, A. J. Cook, Jr., and H. Cook own three copper claims on the Old Backbone, between Cow creek and Pitt river. It is probable that the North Cow Creek section will resume operations. The Enright estate, which owns the Peck and Afterthought copper mines, is negotiating for the property.

Redding *Democrat*: A shoot of free gold ore has been found in the Mt. Shasta mine. The company is working ninety men and shipping ore to Keswick.——The ledge on the property owned by Crabb & Swanberg, adjoining the Lees-Fowler-Meier property, has widened from a 6-inch vein to a 2½-foot ledge of sulphuret ore. The tunnel is in 175 feet, tapping the ledge at a depth of 150 feet.——The 50-foot tunnel on the Clear Creek mine, owned by Meier, Lees & Fowler, is showing up a body of ore.——In the Sonoma mine, owned by the Mountain Copper Co., a 2½-foot ledge was struck this week. It adjoins the Oro Vista, where Meier, Yoelden, Fowler & Russell are hard at work.——The Bully Hill mine is working and good results are obtained.——The Blowers-Drennon mines on Bully hill are working on a fine body of ore. These are known as the Ydalphia and North Star mines. ——The Ayes Co.'s mine at Copper City is running two shifts. A load of ore was shipped last week. The second crosscut is being made.——The Popejoy & Son, Randall & Crooks group of mines, southwest of Copper City, has stopped work for a short time. They have a body of copper, gold and silver ore.—— The new find of B. A. Graham and A. Smith is of copper ore. It is a large lode and they will start a crosscut.——At the new claims of Abbott & Fluke, near Copper City, the ore contains native copper.

Sierra.

Downieville *Messenger*: Supt. Copeland of the Gold Bluff mine has stationed his large pump at the No. 3 level and has put in a smaller one for sinking. When the shaft is unwatered sinking will be resumed.——The North Fork mine at Forest, recently closed down, has resumed operations, a new company headed by F. W. Page having taken the property. J. O. Jones is Supt.——The Ruby Co. are taking out good pay and have ten men employed.

Siskiyou.

Redding *Searchlight*: The King Solomon mine is in the Salmon river country, seven miles south of the Black Bear. It was discovered several years ago by J. H. Bowerman. A company was organized by F. N. Fletcher, a 6-stamp mill set up, and later a rotary mill. A 1200-foot gravity tramway was built and crushing of ore commenced. The work accomplished has made no great inroads on the pay body. The formation is a mixture of porphyry, quartz and surface earth, and covers a large area. The pay rock is quarried out. In May 1500 tons of it were crushed, the milling capacity being sixty tons per day. There is a limited water supply for the steam power and batteries.

Trinity.

Crafton & Frakes, owners of the Lucky May mine, near Trinity Center, have taken $10,000 out of a pocket in the mine. The gold is coarse. The mine is one-half mile northeast of Lady Slipper point on Coffee creek, ten miles from the mouth of the stream.

W. C. Rubling of Carrville has sold his one-fourth interest in the Kate Foley mine to C. F. Porter of Colorado. The mine is near Carrville. The other three-fourths of the property are owned by J. E. Ferris, A. L. Harrigan and J. Goodyear.

H. J. Wackenberger and brother of San Francisco have bought the Fortune placer mine in Halls gulch on the East Fork of the Trinity river, from C. Carter, the price being $4500. It covers forty acres.

Tuolumne.

Sonora *Magnet*: The Gold Ridge M. & M. Co. has been incorporated in Sonora. Directors, F. P. Otis, W. Jones, E. A. Jones, R. Inch, E. Twist; F. P. Otis, president; F. Sutton, secretary; W. Jones, treasurer and manager. The corporation has 500,000 shares, par value $1. The company owns six claims between the Jumper and Shawmut mines.—— Ores from the Jumper mine near Stent carry 3% sulphurets. Heretofore the values in the sulphurets have not been saved. The Jumper Co. will erect a concentrating plant of twenty-four tables, also a cyanide plant.—At the Rawhide mine the App Con. Co. are having a canvas plant erected with a capacity sufficient to handle slimes from the 40-stamp mill.——A strike in the Big Betsy mine, on the borders of Tuolumne and Mariposa counties, is reported. The vein is said to have increased in width and value.——H. Andrews has struck a good prospect on Five Mile creek, east of Columbia.——The strike made in the O'Hara pocket mine, Brown's Flat, has panned out $4000. Elsbree Bros. and O'Hara are lessees of the claim.——R. C. Woodruff has bonded the Hyahapoo mine, above Pine Log, on the south fork of the Stanislaus.——Reed & Day have recently struck a prospect close to the Hyahapoo.——The Hazel Dell mines, eight miles north of Soulsbyville, has made surface improvements, including a 4-stamp mill and bunk house. The mill will start up about July 1st. They have a supply of ore on the dumps. The property is owned by the Jubilee G. M. Co.

Carters *New Era*: A body of ore has been discovered in the Donella mine, near Arrastraville.——Concentrating and cyanide plants are to be placed at the Jumper mine, near Stent.——W. S. O'Brien is finding good prospects in his mine near Buchanan.——Smith & Brady, on Bald mountain, have struck a pocket of gold.——The Gold Ridge M. & M. Co. has been incorporated, with F. P. Otis, W. Jones, Mrs. E. A. Jones, R. Inch and E. Twist as directors.——The 5-stamp mill being repaired at the Rising Sun is nearly ready and will be running in ten days. Attention is being given to the new concentrators. An office is among the recent improvements.—— The Pearl mine, near Confidence, has been bought by M. Tait of Los Gatos and develop-

ing work is progressing. A mill will be erected on the property.

COLORADO.

BOULDER COUNTY.

Ward *Miner*: A. J. Gormley and associates are working the Hidden Treasure group at Bloomerville. The crosscut tunnel is in 400 feet. In driving the tunnel several leads have been struck that show good streaks of mineral.— The San Blas upraise has been driven in mineral all the way from the tunnel level and in places the pay streak widened into pockets of iron ore. The upraise is being made for a working shaft. Seventy feet more will open the shaft to the surface.——The B. & M. mine which shipped ore to the Globe smelter was instructed to cease further consignments until settlement of the difficulty. Work is confined to running the upraise 250 feet west of the main shaft and extends 450 up from the lower level; 200 more feet will bring it to surface.

CLEAR CREEK COUNTY.

(Special Correspondence).—A hoisting plant is to be installed on the Lord Byron and the 340-foot shaft is to be sunk 1000 feet deeper. It is stated the workings are now in a good grade of ore.

Georgetown, June 17th, '99.

Another strike in Onie Bell is reported. The quartz fills the face of the drift.

The eight-hour law did not affect Silver Plume materially. The miners employed by the Humphrey Spelter Co. now work eight hours at the same pay as was previously received for ten hours.

FREMONT COUNTY.

(Special Correspondence).—The chlorination works of the National Gold Extraction Co. at Florence are expected to start up by June 20th, to handle none but Cripple Creek ores. This company operates a crushing and sampling plant at Goldfield near Victor, where all the coarse crushing is done for the chlorination mill. The latter is well equipped, having some features that are new. In the roasters, crude oil from near-by wells is used for fuel, and coal is used for power. The solutions are forced to the barrel floor by compressed air. There are two chlorine barrels, 15x7 feet, holding eighteen tons each. The tailings from the barrels are conveyed to a separate building and there concentrated by six double-decked concentrators. Mgr. J. Q. McDonald states that the plant will be worked by three eight-hour shifts. It is learned that the Metallic Extraction Co. at Cyanide has worked on this plan since June 1st. WASCOTT.

Florence, Colo., June 14th, '99.

GILPIN COUNTY.

(Special Correspondence.) — The 2200-foot shaft of the California mine is being unwatered.

The Cook mine shipped 675 tons of concentrates and 133 tons of smelting ore for the month of May.

Blackhawk, June 17th, '99.

LAKE COUNTY.

Leadville mines are shipping large quantities of sulphide ores to the Philadelphia Smelter at Pueblo.

PITKIN COUNTY.

(Special Correspondence).—The merchants and business men of Aspen have incorporated the Home M. Co. to do prospecting and development work in Pitkin county.

Aspen, June 18th, '99.

SAN JUAN COUNTY.

Denver *Republican*: The leading mines of this county have nearly all closed, and most of the others will close within a day or two. The Porter coal mines, which have depended upon supplying coal and coke to smelter and mines, will close. There are employed 150 men.

SUMMIT COUNTY.

Denver *Republican*: C. L. Westerman of the Golden Crown placer, two miles south of Breckenridge, is putting in boxes and getting the Golden Crown in shape. This placer is familiarly known as the "Goose Pasture."——The Hamilton mines, operated by the Hamilton G. M. Co., located in Summit gulch, will start up in a few days, having been closed down for a month on account of the blockade. The past two weeks teams have been hauling concentrates which accumulated during the blockade of the railroad.

TELLER COUNTY.

(Special Correspondence).—The Modoc is developing extensively and blocking out high-grade ore.

Three sets of lessees on the Nightingale and Nighthawk, on Bull hill, are shipping $60 to $70 ore. It is announced that this group is about to be sold.

The Standard tunnel, which has progressed 3000 feet into Beacon hill, has ceased work, owing to an excess of water.

The nineteen months' lease on the La Conning mine, on Beacon hill, has been bought by the Pueblo G. M. Co. for $10,000. The property is in a rich body of ore.

The Flourine, on Copper mountain, has begun operations and are taking out $26 ore.

The Mahoning G. M. Co. of Youngstown, Ohio, is working two shifts developing their property on Rhyolite mountain.

E. E. Miller, who has 200 acres of placer ground in Bison park, at the foot of Cow mountain, made tests of black sand therefrom which ran $62 to $380 per ton.

A 13-foot vein of oxidized ore was encountered this week on the property of the Dillon G. M. Co. on Battle mountain. M. Finnerty of Denver is Mgr.

Parties in control of the New England & Cripple Creek G. M. Co., principally Boston people, purchased the Chesapeake group of eight and one-half acres on Battle mountain on the 13th inst., paying $100,000 cash therefor. The selling parties are the Bradburys of Canyon City, Colo. The deal was negotiated by C. D. Hall of Victor. E. A. Stevens is consulting engineer and Gen. Mgr. of the property, which will be equipped for sinking two shafts.

The Lucky Gus, under several sets of lessees, is shipping 100 tons of ore per month.

The Mary Jane, on Raven hill, has completed its 200-foot shaft and has let a contract for sinking 100 feet deeper and 50 feet of drifting. Mgr. H. A. Clapp says they are putting in a 15 H. P. electric hoist.

The Rex Investment Co., of which H. A. Clapp is Pres. and A. C. LaBrie is Sec'y, is to make some Cripple Creek mining investments.

The Thompson mine, on Raven hill, is shipping 1800 tons per month, most of which is milling ore. The mine is worked through a 485-foot shaft and is managed by G. M. Weeks.

The Gold Sovereign, on Bull hill, is being developed and worked by several lessees. The principal one, of which E. Snyder is Mgr., is worked through a 500-foot tunnel, at the breast of which a winze sinks 100 feet on the vein, from which high-grade ore is shipped. Some of it ran as high as thirty-two ounces gold.

The John A. Logan, on Bull hill, belongs to W. S. Strattou, and is developed and equipped. The three-compartment shaft has been sunk 1000 feet within the past year. Stations are cut at every 100 feet, from which levels are driven on the vein. The ore is being blocked out, and as yet none of it shipped. W. H. Hart is Supt. WASCOTT.

Victor, Colo., June 15th, '99.

(Special Correspondence).—The net earnings of the Elkton mine, Cripple Creek district, for the year ending June 10th, '99, were $170,000, of which $120,000 was paid to stockholders in dividends. The ore produced amounted to 22,252 tons, the gross average value of which was $28 per ton. The underground work is summed up in 193,000 cubic feet of stoping, 2311 feet of drifting, 726 feet of crosscutting and 780 feet of upraising.

Elkton, Colo., June 13th, '99.

The Last Dollar, on Bull hill, has put in a new 16x30 hoist, to be operated either by steam or electricity. It is the intention to sink the present 650-foot shaft 200 feet deeper.

The Raven G. M. Co. shipped 125 tons of ore from their Raven Hill mine on the 17th inst., which is claimed to have run from two to six ounces to the ton in gold.

Blickenstaff & Co., lessees on the Lucky Gus, have shipped 200 tons of ore from the tenth level of that mine, which ran from two to three ouncez to the ton.

Denver *Republican*: The shipments recently marketed from the Last Dollar at Cripple Creek were settled for at the rate of $1900 to the ton. There were ten tons in the lot. The extent of the new ore body has not been determined. The rich streak is in some places 18 inches wide. Alongside is a wider streak good for eighteen to twenty ounces to the ton. The shipments made were saved in running the drift on the ore.——The National Mining & Leasing Co., capitalized at $800,000, has been incorporated. Pres. G. B. Mechem, Sec. R. W. Griswold, F. T. F. Bonneau and C. H. White will be the directors. The properties of the company are the Hornet, Comet, Twilight, Xenia and May Day, about twenty-one acres on the north slope of Tenderfoot hill, running over on to Carbonate hill. They adjoin the Buckhorn.

IDAHO.

The Seven Devils M. & D. Co. has been chartered under the laws of New Jersey, to operate gold and copper mines in Idaho, Utah and Arizona, and intends to increase its capital, as occasion requires, up to $10,000,000. The directors are N. Appleton, S. L. Powers, W. L. Pratt, H. A. Gammon, Boston, Mass.; N. Treweek, Salt Lake City, Utah; L. Crandall, Globe, Ariz.; G. L. Shoup, H. F. Wild, G. A. Rahm, Boise City, Idaho.

The Checkmate mine at Willow Springs, owned by Salt Lake and Ogden parties, is shipping ore to Salt Lake. J. Young, agent of the company in Salt Lake, says plans for a mill are under consideration. The ore body has been opened 500 feet.

S. Wilson has discovered a vein of graphite and one of asbestos in the Seven Devils country, ten miles from the Peacock mine. A single location covers both veins.

Salt Lake *Tribune*: A strike is reported on Salmon river. The discovery is quartz, near Shorty's bar, four miles below the mouth of White Bird creek and sixteen miles from Grangeville. The discoverers are C. Davis and W. Cash, and out of fifty assays none went under $10 per ton in gold. The formation is porphyry and the ledges are large.

Spokesman-Review: At Wallace the Helena-Frisco, which is oparated under the management of J. McDonald, thirty men with machine drills are employed. It is expected that more will be added.——The Empire State at Wardner is working almost a full force of non-union men. A few more machine men could be employed, but there are plenty of laborers.——On Canyon creek the Helena-Frisco M. & M. Co. are reported to have bought the Black Bear mine and the Milwaukee M. Co.'s property. The Black Bear joins the Frisco on the north.

NEVADA.

The necessary repairs to hydraulic elevator No. 1 at the C. and C. shaft having been made by the Risdon Iron Works, San Francisco, Cal., the repaired section will soon be in place and the lowering of water below the 1950 level continued.

On the 1750 level of the Con. California & Virginia they are making preparations for stoping the ore found 94 feet south of the west crosscut. In a few days work on the 1800 level, through the winze leading from the 1750 level, will begin. Between the 1750 and 1850 levels, where work is going on, the ground is well drained. Elevator No. 2 is keeping the water below the 1850 level.

The Eureka Con. mine of Eureka district shipped 266,600 pounds of ore for the week ending June 16—the largest shipment from that mine in a long time. More men are at work in the property than at any time for five years. The other mines of Eureka district are producing and shipping ore to the smelters at Salt Lake City, Utah.

Winnemucca *Silver State*: F. Wendel, owner of the Sadores placer mines, eighteen miles north of Winnemucca, in what is known as Dutch Flat, has found gold-bearing quartz which he thinks is from the ledge from which the gold from the placers originally came. The placers have been worked four years and $30,000 taken out.

NEW MEXICO.

The Cochiti G. M. Co. will erect a large electric power plant at the Madrid coal mines near Cerrillos, thirty-five miles from Bland.

Elizabethtown *Miner*: The Confidence people are hauling ore from their property on Grouse gulch to the mill.——Machinery for the Edison mill is on the ground.——C. Wood, of La Junta, Colo., is at Hematite looking after the mining interests of the La Junta syndicate in that camp.——J. W. Slater of California has leased the Ponil placers from Mathews & Merry and has commenced work.——A. C. McLeod, who has been in the camp the last year superintending the erection of several mills, left a few days ago for Denver.——The Blue Bandana people have, at the 425 level, run a drift 65 feet.

OREGON.

Baker City *Democrat*: A strike has been made in the Imperial mine, one of the Grey Eagle group, at Cable Grove, the property of J. C. Young and Mr. Colbath. The vein is 8 to 20 inches wide, in a raise at the end of a 600-foot tunnel, where the ledge is 5 feet wide. The ore from this new find will go $200 to the ton. Mr. Young will commence shipping.

Baker City *Republican*: Since February the Ibex mine, near Baker City, has been under the management of S. Chapman, who has run a crosscut 200 feet, two drifts on the vein 400 feet each, and numerous crosscuts of the vein from wall to wall, showing an ore body from 8 to 15 feet. Two shoots of ore have been opened in the upper and lower levels. A working shaft has been started on one of these and steam hoists will be ordered for the sinking of two shafts 500 feet. No ore has been shipped and none taken out excepting that taken out in prospecting.

SOUTH DAKOTA.

The Alta-Lodi mine at Meyersville, operated in 1880 by an Eastern company and abandoned as worthless, is now being successfully worked by J. Cochrane who commenced operations with an arrastra and has later put in a rotary mill. The vein is 80 feet wide and is worked by an open cut.

The Uncle Sam shaft is being sunk to the level reached by the old incline sunk several years ago before the mine was shut down. This mine made its discoverers rich, who worked a rich pay streak in a small way; but when a 60-stamp mill was built on it and thousands of tons of waste rock were run through it, the pay fell off and a shut-down resulted.

UTAH.

The Bingham Placer Co. has been washing gravel for several days and the material has an average of about $5 per cubic yard.

Salt Lake *Tribune*: At the Star Consolidated at Tintic the management is loading for shipment eight or ten carloads taken from the 400 level, where the ore body increased and where the largest body of ore ever seen in the mine is exposed. The shaft has reached a depth of 600 feet, where a station is being cut.——It is reported at Park City a larger number of persons are employed than at any period in years.——Dubuque Gold M. Co., in Mercur district, will let a contract to continue the incline to a depth of 260 feet. The manager is J. McNamee.——The Wautuaka group of claims in Big Cottonwood is to be the basis of the Germania G. & S. M. Co. by Chicago and St. Louis men. Felix J. Stark is promoting the organization.——J. R. De Lamar has purchased 108 acres of ground of the Rover M. Co. at Mercur for $175,000. The Rover ground is accessible through the workings of the Golden Gate, and could be reached by extending a drift from them.——M. Beamer and W. Wilt have sold to the De Lamar interests the W. J. Bryan and Frank J. Cannon, it is said, for $75,000.——In the Northern Light mine at Zion Hill a rich streak carries ore running 400 to 500 ozs. silver. A carload of second-class ore recently returned 190 ozs. silver, $5.10 gold and 5 % lead.——At the Hercules Mgr. Mitchener has a body of high grade ore different from anything seen in the camp.——The owners of La Plata mine in the Logan district, southern Utah, have refused a proposition to bond their property.

Mercur *Miner*: The Helvetia has made connection between their north and south shafts through the 400 level. They are in a body of milling ore and are considering the erection of a mill. Thirty-five men are employed.——Work is to be commenced by the new owners of the Golden Gate Extension property. Bids are being asked for the timbering of 200 feet of the old shaft of the Golden Gate Extension.——A. P. Baldwin of Akron, O., has taken an option on Mr. Veitch's interest in the Mollie claim in Ophir district. Mr. Baldwin has arranged with Mr. Veitch to do development work on the property.

Tintic *Miner*: A 5-inch streak of galena ore which samples 12% lead and thirteen ounces silver has been cut in a drift from the bottom of the 120-foot shaft of the Quartzite, adjoining the Swansea, owned by A. Baxter.——A 3-foot vein of copper and lead ore has been cut in a crosscut from the 100 level of the El Rey. The shaft is down 140 feet.——Assays from a winze on the ore body of the May Day show 47.5% lead, 9.5 ounces silver and $2.30 gold.——The Lilly mine on the Tintic east slope have made their first shipment of ore, which netted between $2000 and $3000. The ore body was struck two weeks ago and a vein 4 feet wide is being followed on the 200-foot level. The owners are T. Barrett, president; W. M. McKenrick, secretary; H. and S. Barrett, P. P. Hindmarsh, I. Collins, E. Peck, J. T. Clark, Mrs. M. E. McGraw of Provo.——For a half interest in the South and West Mammoth, the Black Jack and Trail mining claims at Mammoth, Tintic district, J. Knight of Provo paid $45,000 to D. Evans, the original purchaser of the group. The territory in the transaction adjoins the Ajax M. Co. and Star Consolidated, lying to the south, owned by Mr. Evans. Mr. Knight has joined him in establishing a co-partnership under which development will commence. A three-compartment shaft will be sunk.

WASHINGTON.

The Warren G. M. Co. at Republic has bought the claims owned by the Union G. M. Co. and the D. D. G. M. Co. These are the D. D., Union, Finger Board, Hunter and Evening Star and the Warren and D. D. fractions, and form a group north of the Iron Mask and Flag Hill claims in the west belt of Republic.

Loomis *Prospector*: The Little Falls Co. are sacking ore and expect to ship a car within the next two weeks.——J. J. Enright of the Grand Summit No. 2 reports the work showing up good ore.——At 75 feet in the shaft on the Wehe property rich ore carrying gray copper has been struck. Parties from British Columbia have been looking over the property in the interest of Toronto people.——In the Utica, at a depth of 12 feet on Douglas mountain, a 5-foot vein has been struck, reported to assay $81 in gold. The shaft will be continued on the vein 100 feet.

WYOMING.

Grand Encampment *Herald*: The shaft on the Daisies mine is down 45 feet and machinery is necessary for further work. Upon his return, in ten days, Mr. Powell will let a contract for sinking the Daisies shaft to water level.——A copper discovery has been made two miles west of Grand Encampment by J. Smith. The discovery is a 2-foot vein of white quartz streaked with bornite and copper glance. The claim is located on the plain half a mile from the hills.——A train of eight six-horse teams is employed hauling copper ore from the Ferris-Haggerty mine to the railroad; 600 tons are to be shipped.

FOREIGN.

AUSTRALIA.

The semi-annual report of the Mount Lyell M. & R. Co., Limited, shows a net profit of £110,000, due largely to advance in price of copper, as other conditions have not changed materially.

Melbourne *Standard*: The Prince of Wales gravel mine at Sebastopol, Victoria, after being shut down for two years, has been reopened by tributers. Irrespective of a good area of reef wash, 1800 feet of the old gutter remains unworked.

Coolgardie *Pioneer*: Mr. Merton has discovered a vein 100 feet wide, 9 miles north of the Flying Pig mine, in Western Australia. Within a few days he had ninety-nine tons crushed at the Waitekauri battery, from which 634 ozs. of gold was obtained. He has since had a crushing of eight tons at the Leonora battery which has averaged 10 ozs. per ton.

BRITISH COLUMBIA.

Several mines in the Slocan and Nelson districts have raised miners' wages to $3.50 per day for a shift of eight hours.

Fort Steele *Prospector*: Twelve men are at work on the Big Chief, near Fort Steele.——A. Banks has made a strike on his claim in Victoria Gulch. A perpendicular ledge of quartz 15 feet in width has been exposed. Assays across the ledge give $6 per ton.——The management of the Tracy Creek M. Co. will be in charge of N. A. Wallinger of Fort Steele.

Victoria *Times*: A strike is reported on the Black Hussar, Slocan City.——The Slocan Star shipped 120 tons of ore last week, and the Whitewater 115 tons.——Work on the Fisher Maiden is to be resumed. C. F. Lee has made an examination of the property.——The Rain Bow group, Slocan City, has been sold for $10,000.——The Noonday mine, above Silverton, is working a jig that saves from otherwise worthless rock, concentrates that run 90 ounces silver and 40% lead to the ton.——A strike was made on the Hartney, on Silver mountain, last week, 500 feet below the tunnel, and was covered by 3 feet of wash.——A new find on the Silverton Boy, one of the Emily Edith group, is reported. The work of ground sluicing for the vein started some time ago and a ledge has been uncovered that carries a 2-foot streak of quartz and galena.——Preparations are being made by the Coin Development Co. to do development work on the Coin Fraction, near Cody. A flume 1000 feet long will bring water from Carpenter creek for ground sluicing to expose the lead.

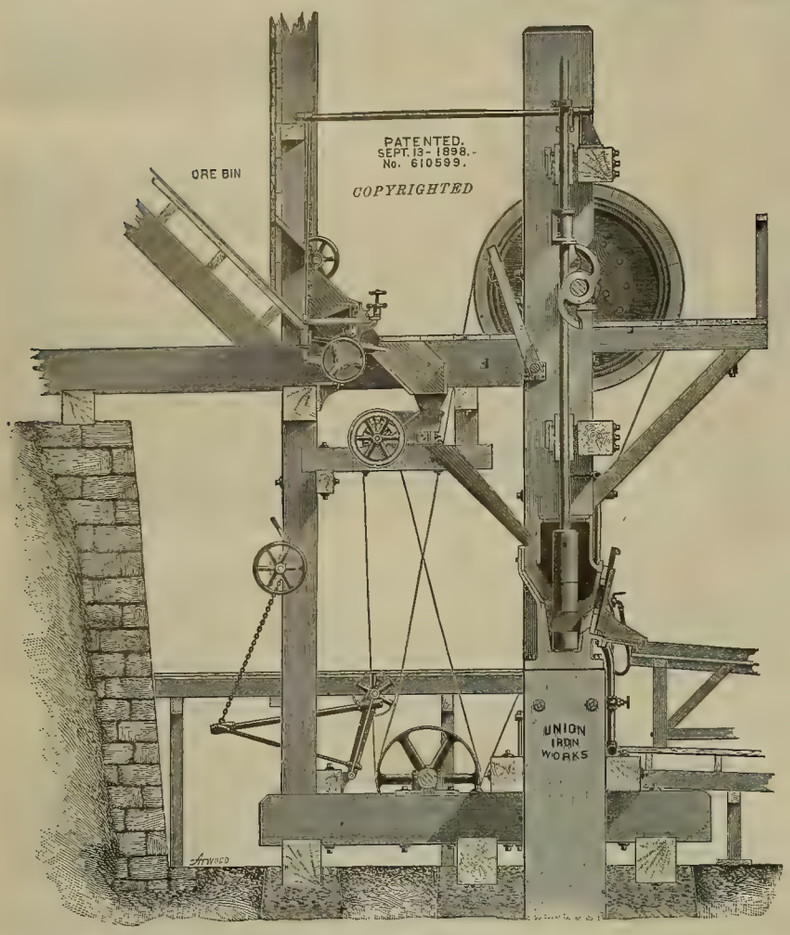
LOWER CALIFORNIA.

The placer mines at Cerro Pintado are not proving as rich as first reported. Gold is to be found in the alluvial of the gulches heading around the mineral colored hill called Cerro Pintado, but the diggings are low grade and have thus far proved disappointing to American miners who stampeded into the region. Many are already leaving the field and returning to the United States.

Seventy-five miners have returned to San Diego from the Cerro Pintado placers. All say the placers are poor, the average yield being not over $1.50 per day to the man. H. L. Swain, a representative of the Chamber of Commerce of San Diego, says in a letter: "The placers cover ten miles square, but the workings are confined to the river beds (dry). Prospectors are finding new fields, but their extent and richness seem limited. This will never be a rich placer country. Many are prospecting for quartz ledges, and some claim to have found veins carrying gold, but I have been unable to substantiate these statements."

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.



THIS ILLUSTRATION

Shows our patent Improved Stamp Mill, with Secondary Crusher, which increases the capacity of the ordinary stamp battery from 25 to 30 per cent.

We respectfully invite the attention of those contemplating the erection of new mills to this practical improvement.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.

Send for Dredging Catalogues Nos. 15 and 16.

—WE ALSO BUILD—

All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

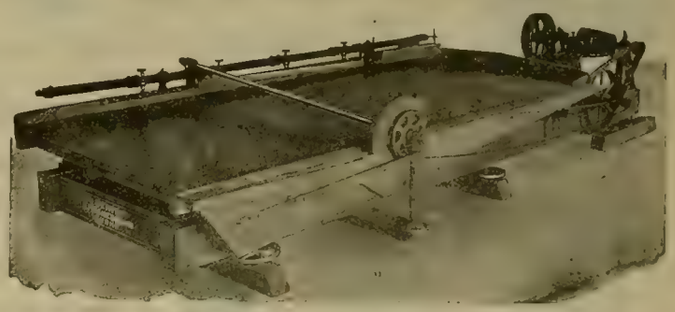
We publish sixteen catalogues. Write for one in the line you are interested in.

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

The perfect vanner motion given to the pulp by our head motion, together with the freedom from "jumping" resulting from the special rigid guides used, explains why the Cammett riffles never "pack," and why the table has such a great capacity when handling slimes.

The continuous grooves and riffles extending from end to end of the table maintains the greatest possible margin of safety between the concentrates discharge and the tailings.



Thoroughly Protected by Strong Patents. Write for Circular.

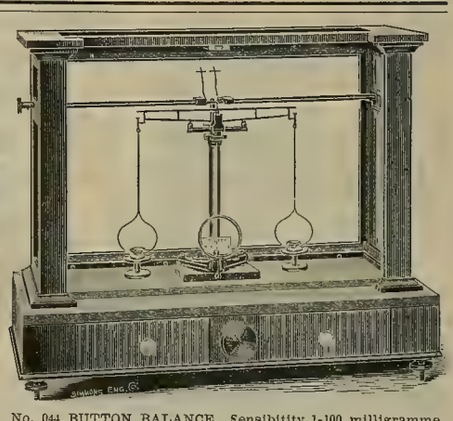
Operator taking courses or horizontal angles with BRUNTON'S PAT. POCKET MINE TRANSIT.
If you wished to find the angle between two points below the horizontal with a sighting compass or an ordinary transit, you would first have to set up your tripod or staff and then level up your instrument. All this takes time.
If you only wanted to get the angle within a degree or so, you could take a BRUNTON TRANSIT, and, holding it in the position shown, take your readings in less time than you can place any other instrument. Send for descriptive catalogue B to



No. 044 BUTTON BALANCE. Sensibility 1-100 milligramme. If you are in the market for the very best balance obtainable at a moderate price, write us for particulars about the No. 044. You will be surprised to find how cheaply it can be purchased for cash. While we cannot recommend this balance for fine gold work, a great many assayers are using it for such successfully. Send for illustrated catalogue A, for complete description and prices, to

WM. AINSWORTH & SONS,
(Successors to WM. AINSWORTH.)
DENVER, COLO., U. S. A.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

MAIN BELTING COMPANY,
1225-41 Carpenter Street, Philadelphia.
55-57 Market St., Chicago. 130 Pearl St., Boston.

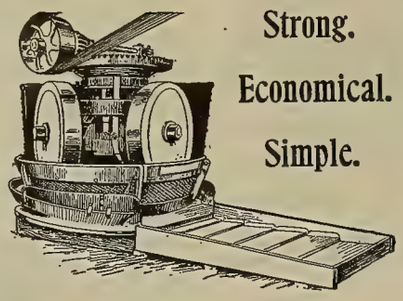
THE BRYAN ROLLER QUARTZ MILL.

We are the sole manufacturers of this Mill. A test made by the Bullion-Beck Co. of Eureka, Utah, with this and the Huntington Mill proved conclusively every claim we made for the Bryan Mill, viz: that the Bryan would crush more ore with less repairs, less power and less slimes than any Mill made. Result—they are now operating three of the five-foot Bryan Mills and find them superior and more satisfactory than any Mill they ever used. L. C. Trent & Co., who had formerly sold the Huntington Mill, immediately manufactured a Mill infringing our patent. Suit brought in the U. S. Court resulted in a verdict in our favor, and we shall prosecute to the full extent of the law any infringement of any character whatsoever in the MAKING, USING or SELLING of the same. : : : : : : : : : : :



Strong.
Economical.
Simple.

MANUFACTURED BY

The BRYAN MILL is constructed on the principle of the Chili Mill, except it has three rollers arranged to run in a continuous discharging pan. It crushes either gold or silver ores. It consists of an annular cast-iron mortar with fixed steel dies arranged in the path of its three crushing rollers. Power is applied direct from a pulley through a bevel gear and pinion secured to stationary center post. We present a few of many advantages it possesses over any other Mill: Larger screen capacity and free discharge. Amalgamates a larger percentage of gold. Quickly and cheaply erected; with regular feed and proper flow of water requires little attention. Crushes hard or soft ore with smaller amount of power per ton and less wear and tear of machinery. : : : :

Send for Catalogue No. 8.

Assessment Notices.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Forest Hill Divide, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of June, 1899, an assessment (No. 19) of one-half of one cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 1209 Claus Spreckels' Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of July, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 29th day of July, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. J. CRAWFORD, Secretary.

Office—No. 1209 Claus Spreckels' Building, San Francisco, Cal.

CENTRAL EUREKA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sutter Creek, Amador County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 26th day of May, 1899, an assessment (No. 12) of two cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 9, 320 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3d day of July, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 24th day of July, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

WM. A. M. VAN BOKKELEN, Secretary.

Office—Room 9, 320 Sansome street, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 7th day of June, 1899, an assessment (No. 7) of five (5) cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, No. 773 Mission St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of July, 1899, shall be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 1st day of August, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California.

MAYDAY GOLD AND SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 31st day of May, 1899, an assessment (No. 2) of ten cents (10c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 24 Post street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of July, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of August, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. P. HEALD, Secretary.

Office—Heald's Business College, 24 Post street, San Francisco, California.

BOULDER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of May, 1899, an assessment (No. 3) of three cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 163 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of July, 1899, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 27th day of July, 1899, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

Market Reports.

SAN FRANCISCO, June 22, 1899.

SILVER.—London, 27 13-16d; New York, 60⅝; San Francisco, 60⅝; Mexican Dollars, 49¼@50¼; New York exchange, sight, 12½; telegraphic, 15 cents premium.

LEAD.—New York reports easier, $4.45 bid, $4.50 asked; brokers' price, $4.25.

Local, pipe, 7¼@7½c; sheet, 7¼@8¼c; pig, 6½c; bar, 6.50c.

COPPER.—New York reports Lake dull at $18 bid, $18.50 asked; brokers' price, $18 25; mill copper plates, 23¼c.

The Chinese are said to be smelting their copper coins and exchanging the product for silver. The Oriental races seem to prefer the white metal to the yellow.

IRON.—American, soft, $22.50@24.50 per ton; Scotch, $27.50 Local bar, 2¾c per lb.

STEEL.—12¼@13c per pound.

TIN.—Steady, $25.65 bid, $25.70 asked; pig, 31c per lb.; Bar, 35c. New York weak, $23.85 bid, $25.50 asked.

ANTIMONY.—In San Francisco 1000 pounds and upwards, 10c net; 300 to 500 pounds, 11c; less than 100 pounds, 15c.

BABBITT METAL.—No. 8, 8¾c.

QUICKSILVER.—Local, $43; export, $39.00 @39.50; carload lots, special rates.

The visible supply of quicksilver in London is diminishing. While exports were regular for four months ending May 1st, '99, the supply was reduced over the corresponding period of '98 by 11,000 flasks. It is thought the slight advance in the price of silver will stimulate silver mining, which in turn would create a larger demand for quicksilver, with a corresponding advance in price.

PLATINUM.—London, 63½s per ounce; York, $16.25; San Francisco, $16.75.

ASSAY LITHARGE.—100 lbs., 12c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13¼c; less than one ton, 15½c, No. 1** 50%, carload lots, 11¼c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9¼c; less than one ton, 11¼c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

FUSE.—Triple tape, $5.10 per 1000 feet; double tape, $4.35; single tape, $3.45; Hemp, $3; Cement No. 2, $4.35; Cement No. 1, $3.45.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

COAL.—San Francisco coast, yard prices:

Wellington	$8 00	Coos Bay	$5 00
Seattle	6 00	Southfield	7 50

Cargo lots, Eastern and foreign:

Wallsend	$ 7 50	Cumberland	$ 9 00
Brymbo	7 50	Cannel	9 50
Pennsylvania, hd..	14 50	Welsh Anthracite.	12 50
Scotch	8 00	Rock Springs	7 60

COKE.—Foreign, $13; domestic, $12 per ton.

CHEMICALS.—Cyanide of potassium, jobbing, 32@33c per lb.; carloads, 29@30c; in 10-lb. tins 37c; sulphuric acid, 1¾c per lb. 66° B.; soda ash, $1.60 per 100 lbs. 58%; hyposulphite of soda, 2½@3¾c per lb.; blue vitriol, 4½@5c per lb.; borax, refined, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 2¾c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1½@1¾c; nitric acid, in carboys 8c per lb; caustic soda, in 10-lb. tins 15c per lb.; Cal. s. soda, bbls., 65c; sks., 60c ₱ 100 lbs; chloride of lime, spot, 2.10 @2.25c; saltpeter, 14c; chlorate of potash, 25c; caustic potash, 12c.

CANDLES.—Electric Light Candles—6s, 16 oz., 8¼c; 6s, 14 oz., 7¼c; 6s, 12 oz., 5½c; 6s, 10 oz., 5½c; Granite (Mining) Candles—6s, 16 oz., 9¼c, 6s, 14 oz., 8¼c; 6s, 12 oz., 7½c; 6s, 10 oz., 6¾c. Paraffine Wax Candles—1s, 2s, 4s, 6s, white, 10c; colored, 11c.

Mining Stocks

BOUGHT and SOLD.

For reliable information, write to

JOHN HAWLEY, - Vancouver, B. C.

Codes used: Clough's and Moring & Neal.

FOR SALE.

One 150 H. P. Corliss engine, in first-class condition; size of cylinder, 18x48. Also, one Buckley condenser. For particulars, apply O. N. B. & C., P. O. Box 2096, San Francisco.

MINING ENGINEER,

with eighteen years' practical experience in all branches of mining work, wants position as superintendent, assayer, surveyor or bookkeeper. Address "Cupel," care Mining and Scientific Press.

Mining and Mechanical Engineer of twenty years' experience desires engagement, for family reasons, in locality below an altitude of 6500 feet. Mining and concentration a specialty. Address "Concentrator," care Mining and Scientific Press.

WANTED,

Position as Assayer and Bookkeeper.

References: Abbot A. Hanks, Baldwin & Howell, S. F. Address W. B. HOAG, Berkeley, Cal.

AN ACCOUNTANT

Of seven years' experience with mining company desires a position in any country. Good references. Address C G., this office.

MACHINERY — FOR SALE OR LEASE, all or half interest in the Cripple Creek Machine Shops and Foundry. This is the largest and best equipped plant in the district; or will trade for good mining property or stocks in the Cripple Creek district. Party must be practical and competent to take charge of and manage the business, as owner is giving his attention to mining. Address the Cripple Creek Machine Shops, Cripple Creek, Colorado.

Group of Gold and Silver Mines for Sale.

For sale on very reasonable terms, or leasing proposals will be entertained, a group of gold and silver mines in the State of Durango, with excellent old records and some good modern machinery. For full particulars apply to MR. A. KEMPSON (Resident Agent), care of Mr. Stalcknecht, Durango, Mexico.

..CRIPPLE : CREEK..

FOR SALE—CYANIDE PLANT,

100 tons daily capacity; in first-class condition to handle Cripple Creek ores.

Plant in full running order, with all latest improvements. Address JOHN S. MACBETH, Equitable Building, Denver, Colorado.

PROPOSALS ARE INVITED FOR THE CONstruction of a pumping plant and pipe line at Minas Prietas, Sonora, Mexico. Length of line, about 16½ miles; delivery 275 feet higher than intake; capacity 300,000 gallons per 24 hours, with margin to allow of increase to 600,000 if required; pumping plant of sufficient power to do work required with most economical use of steam, and pipe of suitable strength to allow a safe margin over pressure it may be called upon to stand. Contract for material and installation will be let as a whole, or separate contracts will be made for furnishing material and installation, as the company may determine. For further information, profile of line, etc, address W. T. BARRETT, Minas Prietas Water Co., Torres, Sonora, Mex.

Quicksilver

FOR SALE IN LOTS TO SUIT.

Agents for Redington Quicksilver Mine.

REDINGTON & COMPANY, Wholesale Druggists, 23-25-27 Second Street, San Francisco.

S. O. Graham, J. H. Garrett, J. W. Helsner, T. E. Dexter.

GRAHAM, GARRETT & CO.,
211-212 Peyton Block, SPOKANE, WASH.
MINE PROMOTERS, AND BROKERS.

Make a specialty of promoting, operating and developing mines. We handle all standard stocks.

Our specialties are: Syndicate G. M. Co., Syndicate Camp, Idaho; Admiral Dewey G. M. Co., Republic, Wash.; Mabel G. M. Co., Republic, Wash.; Juno M. & M. Co., Republic, Wash.; Ninety-Eight G. M. Co., Republic, Wash. Send for free maps of Republic Camp. Codes used: Moring & Neal and Clough's.

DELINQUENT SALE NOTICE.

71	414.4	99	500.
73A	12.3	100	478.7
74A	21.3	101	119.

Each tender shall specify the numbers of the claims and fractions tendered for and also the amount of bonus offered for each claim and fraction. The tender may be for the whole lot or any one or more of the claims and fractions and must be accompanied by an accepted cheque in favour of the Minister of the Interior for ten per cent of the amount offered, one-half of the remainder to be paid into the Department of the Interior at Ottawa or to the Commissioner of the Yukon Territory at Dawson within thirty days from notice of acceptance of tender, and the balance within six months thereafter with interest at the rate of four per cent per annum.

Entries for the claims and fractions will be granted in accordance with the Placer Mining Regulations on acceptance of tender.

The entries will be subject to the usual royalty and the provisions of the said Regulations from time to time in force, except as to representation provided for by Clause 39, which will not be required.

The claims and fractional claims for which entries may be granted shall not include any portion of the bench or hill claims for which entry may have been previously granted.

The highest or any tender not necessarily accepted. JOHN R. HALL, Secretary.

Department of the Interior,
Ottawa, 27th May, 1899.

Mining and Metallurgy.

The latest and best books can be had from the Book Department of the MINING AND SCIENTIFIC PRESS at best prices. ALL BOOKS SENT POSTPAID. Following is a partial list:

ASSAYING:—PART I—GOLD AND SILVER ORES.
Third edition. Rewritten and Improved by the Author, C. H. Aaron: 130 pages, illustrated....$1

MODERN COPPER SMELTING:
E. Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated.....$5

STAMP MILLING OF GOLD ORES:
By T. A. Rickard, M. E. Well illustrated. Cloth.....$2 50

MANUAL OF MINING:
For the use of Mining Engineers and Technical Schools. M. C. Ihlseng. Third, revised and enlarged, edition. 548 pages, 8vo., cloth.....$4

MINERS' POCKETBOOK:
A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. W. Lock. 472 pages, illustrated, flexible leather.....$5

THE METALLURGY OF GOLD:
By M. Eissler. Profusely illustrated.....$5

QUARTZ OPERATOR'S HANDBOOK:
By P. M. Randall.....$2

CYANIDE PROCESSES FOR GOLD AND SILVER ORES:
By E. B. Wilson E. M.....$1 50

PRACTICAL TREATISE ON HYDRAULIC MINING:
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, etc.....$5

PRACTICAL HYDRAULICS:
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall.....$2

SKELETON MINING REPORT:
Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid.....50c

PROSPECTOR'S FIELD BOOK AND GUIDE:
4th edition, just out. By H. S. Osborn.....$1 50

ASSAYING:
Furman, 4th edition.....$3

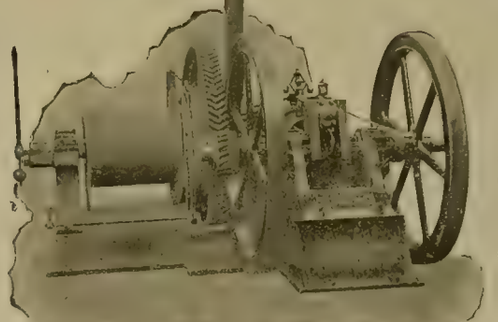
CHLORINATION PROCESS:
E. B. Wilson.....$1 50

HYDRAULIC AND PLACER MINING:
E. B. Wilson.....$2

If you do not find what you want in above list send for catalogue and price list, sent postpaid to any address. **Book Department Mining and Scientific Press, 330 Market street, San Francisco, Cal.**

Utah Mining Districts.

Bingham, Tintic, Park City, Mercur, Marysvale, Gold Mountain, Deep Creek, La Sal, described and illustrated in a sixty-four-page pamphlet, together with a prospector's map of Utah, and claim (grouped) maps of Bingham, Tintic and Mercur, ready for delivery June 20th Send six cents in postage for this, the most complete and reliable write-up of the mineral resources of Utah ever published. F. A. WADLEIGH, General Passenger and Ticket Agent. Salt Lake City, Utah.



FRESNO, June 25, 1898.

Hercules Gas Engine Works,
San Francisco, Cal.

DEAR SIRS:—

The fifteen-horse power gasoline engine and hoist purchased from you is doing fine work and is perfectly satisfactory in every respect.

Yours truly,

TUOLUMNE MOTHER LODE M. & D. CO.,

Per N. W. Moodey, Pres.

We have two large books full of testimonials; they speak better for the HERCULES than we can. Our works are the largest in the country. We have built and sold over 3500 engines; they are the standard everywhere. Any size up to 200 H. P. Stationary, Hoisting and Marine.

Hercules Gas Engine Works,

305 MARKET STREET, SAN FRANCISCO, CAL.

ELECTRICAL ENGINEERING COMPANY,

MANUFACTURERS OF DIRECT CURRENT MACHINERY

For Power and Lighting Purposes.

SPECIALTY

Direct Connected Electric Elevators.

Estimates Given on All Kinds of Mining Apparatus,

ALSO REPAIR AND JOB WORK OF ANY KIND.

Manufacturers of Fouts Patent Rotary Grip Wheel for Logging or Tramway Use.

509-511 Howard St., - San Francisco.
